NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

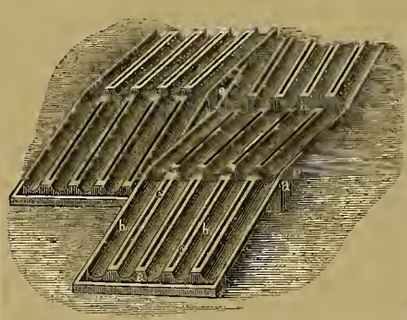
Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

Gold Miners

WORKING PLACER, GRAVEL AND QUARTZ MINES,

SAVE YOUR GOLD!

— BY USING —

SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method. Thousands of orders filled and the demand constantly increasing.

Having very extensive facilities for the manufacture of these Plates, will fill orders for California, Colorado Montana, Dakota, Oregon, Idaho, Utah and adjoining States at prices which defy competition.

TO QUARTZ MINERS.

"The Most Perfect Machine yet Introduced into Mining."

Indorsement—Pool Mine, Hornitos, Mariposa county, Cal., May 10, 1880.

ALMARIN B. PAUL, ESQ—DEAR SIR:—After a trial of your AMERICANIZED ARASTRA we are prepared to say that it runs with less than five-horse power and its capacity all that is claimed for it, viz: Ten tons per day, receiving ore from No. 20 Screen. It runs splendid, and the more we see of it, the better we like it. It gathers much more float gold than we expected it would, and we cheerfully recommend it to the attention of quartz miners as a most thorough pulverizing, amalgamating and concentrating machine. Yours truly, P. W. JOHNSON & Co.

This Arastra can be seen and circulars had, by applying to ALMARIN B. PAUL,

Room 20, Safe Deposit Building, San Francisco

SAN FRANCISCO, SATURDAY, JUNE 5, 1880.

VOLUME XL Number 23.

A Gold Quartz Boom.

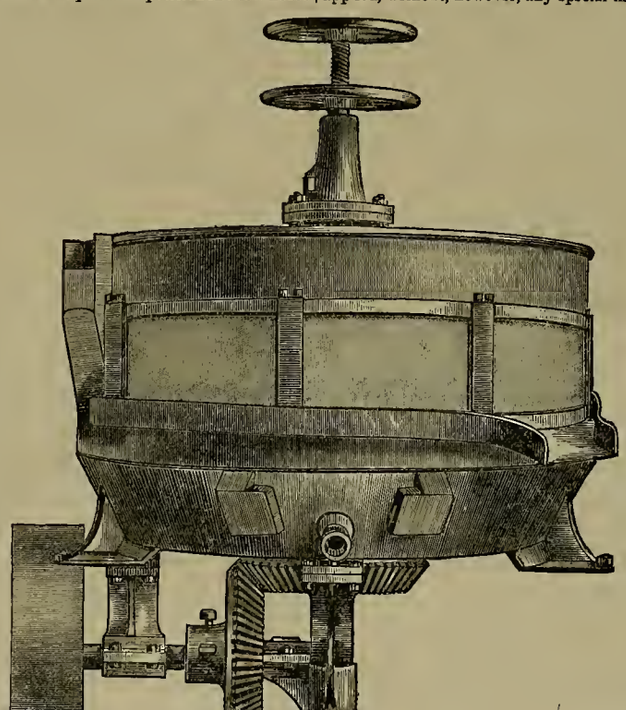
We gather from our large list of mountain exchanges, that there is a veritable "boom" in the gold-quartz regions, and that prospectors have rarely been more numerous or busy. In Calaveras county, for example, the *Chronicle* says the hills swarm with quartz hunters, and that capitalists are waiting eagerly for an opportunity to take advantage of good developments. The boom pervades the county, and many idle and abandoned mines, in the ownership of poor men, are now the scenes of unwonted activity. The *Chronicle* specifies several well-developed mines in the county, which have been sold to S. F. capitalists, the most noteworthy of which is the Lone Star at West Point. It is to be expected that some of the many discoveries which have been or may be made will prove tangible and valuable properties. Apart from this consideration, the boom has already produced much good by the revival of one of the great industries of California. For several years gold quartz mining in our mountain camps had languished or been carried on in a half-hearted way, and mines that were well worth the cost of developing, were permitted to lie idle. In most instances the owners were too poor to work them after reaching a point where machinery became necessary; and capital distrusted a mine that was permitted to lie idle while its owners boasted of its value.

Now that the interest of our enterprising men of capital has been directed to the gold mines of the State as a profitable means of investment, it is to be hoped that the owners of the mines will meet them in a business-like and reasonable way, and offer them fairly prospected veins, or, better still, fairly developed veins, at a price which a business man can afford to pay. Hitherto the business of selling and buying mines has been intensively speculative. It is time that it was placed where it belongs; that is, in the list of ordinary business transactions. Of course, the miner is always entitled to fair pay for prospecting and developing his mine and to a reward commensurate with its known value; after that has been done, all the risk of working the mine and the accruing profits, whether they are large or small, belong to the buyer. And of course, in buying a mine, the purchaser should be allowed—indeed, he should insist upon it—a broad and reasonable margin to cover his probable or possible loss; that is, his risk of loss ought to be reduced to a minimum. There is neither sense nor equity in the owner of an ordinary gold or silver mine, either of which is subject to countless mutations, asking a price for it which amounts to a fortune—which will give him his "pile," as it were, by a lucky turn of the wheel. This is not business, but speculation, pure and simple. It has done much to discredit and discourage investments in mines in California. Indeed, it is of a piece with the policy which kills the goose that lays the golden egg. Place the whole scheme of mining, including the laborious work of prospecting for veins, of opening and developing them, of selling and buying, or of bringing them to fruit—on a common business basis, in which the right, pay, and reward of the miner shall be recognized no less than the right of the capitalist to reasonable protection and ground of profit for his capital, and in our judgment quartz mining will receive a new impetus, and will become one of the most productive interests of the State. It will offer something more than the daily wages to a large class of miners; while to the capitalist it will offer an investment which, with its probable risks, combines also great profits.

Reese River District, Nevada.—Austin, the capital of Lander Co., and the center of the Reese River mining district, is reported to show signs of its old activity and prosperity. The chief company in the district, the well-known Manhattan, has already produced some $20,000,000 from a small part of famous Lander hill. It is now sinking a great working shaft, known as the Lander shaft, which at last accounts was 350 ft. deep. The Nevada Central railroad ought to increase the importance of Austin, for within a radius of 25 miles are situated the districts of Yankee Blade, New York Canyon, Amador, Ravenswood, Big Creek, Washington, Bunker Hill, Kingston and Birch Creek.

A Continuous Discharge, Crushing and Grinding Pan.

We illustrate herewith a new form of pan devised and manufactured by Steiger & Kerr, of the Occidental foundry, 137 First St., in this city. This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of other crushing appliances. The cost of this mill is comparatively little, and the cost of erection, which adds so much to the expense of the stamp mill after it leaves the foundry, is in this case reduced to a fraction, as the mill is complete in itself, and requires no expensive foundations, bed logs, battery, frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor.



STEIGER & KERR'S CONTINUOUS DISCHARGE, CRUSHING AND GRINDING PAN.

The manufacturers give the capacity of each pan as capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock-breaker small enough to go through a half-inch sieve. The grinding and scouring action in the gold before it is discharged is an important feature in this mill, especially when "rusty" gold is encountered. The plan of feeding is the same as in a stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining machinery can see this new pan in operation at the address given above.

International Postage Stamp.—France and Belgium are reported to have just effected arrangements for the introduction of an international postage stamp. Such a measure will greatly facilitate intercourse between the two countries, and marks a decided stride in civilization. It will allow the payment of small sums of money between the countries in stamps, and will permit persons inquiring for information to inclose stamps for a reply. We hope that the good plan will soon be universally adopted.

Copper Leaching.—No. 3.

[Written for the Mining and Scientific Press by C. H. Aaron.]

The methods briefly outlined in Nos. 1 and 2 are adapted only to sulphureted ores of low grade, containing, say, from 1% to 5% of copper, and of which the gangue is not calcareous. Calcareous ores of this low grade will probably be best left alone at present, unless circumstances favor concentration of the valuable portion by fire, air, or water.

Among the most recent and best leaching processes adapted to copper ores of every kind containing from 5% to 15% of the metal, is that known as the Hunt & Douglass, which, when applied, without, however, any special modification, to ores which contain also silver, has been called the

Hunt, Douglass and Stewart Process.

That this process has not been a success, in a few instances, should not be allowed to weigh against it in the estimation of the mining public, since the failures have been due to causes quite outside of the merits of the process, which has been successfully applied in various places, notably in Servia, where a 2½% ore was profitably worked by Rickard.

The Hunt & Douglass process, first made known to us in 1866 as the invention of the celebrated chemist and geologist, Prof. Sterry Hunt, is based on the decomposition of oxides or carbonate of copper by a hot solution of protochloride of iron, forming chloride and dichloride of copper, the first containing 47.17% of copper, and soluble in water or brine, hot or cold; the second containing 64.1% of copper, and soluble practically in hot brine only, for which reason salt is added to the bath of protochloride of iron.

Unlike the preceding methods, this process requires the ore to be reduced to powder, the fineness of which varies with different ores and must be found by trial; for while, as in all cases where ore is to be leached, or lixiviated, a certain degree of comminution is necessary to the success of chemical treatment, yet the mechanical part, that is the filtration or decantation, proceeds better when the material is rather coarse. For this reason that crusher or pulverizer which delivers the ore with the least variation in the size of the particles, is the best, and if its action is also such as to split the stuff into thin, angular and flattened fragments, rather than to grind it into rounded grains, it leaves nothing to be desired. A combination of rollers and sieves is perhaps best for this purpose, and next to it, the pulverizing barrels with constant discharge.

Sulphureted ores must be roasted after crushing, and the natural oxides and carbonates are much improved, chemically and mechanically, by calcination. Calcareous ore must contain enough sulphur to turn the lime into a sulphate. A dead roast is not necessary, as the presence of soluble sulphates is beneficial rather than otherwise. An addition of salt in the roasting is good, especially if the ore carries silver. For furnaces we have the old reverberatory, the Stetefeldt, the White, the Bruckner, the O'Hara, the Ricard and others, all adapted, according to circumstances, to the work.

The roasted ore constitutes a sand containing copper in the forms of oxide and sulphate, or, if salt has been used, chloride; perhaps also silver in metallic state, or as chlorids. Gold, if present, will remain metallic, and will not be extracted by this process. This sand is put into large tubs, provided with revolving stirrers, together with a hot solution of proto-chloride of iron and salt, made, in the first instance, by dissolving common copperas in brine. The action of the stirrers prevents the settling of the sand in a mass at the bottom, and the copper is completely dissolved in from 6 to 18 hours. Silver, if in the form of chloride, is at once dissolved in the hot brine. If metallic, it is first converted into chloride and then dissolved.

There is now a mass of sand and mud, suspended in a solution of copper, and perhaps silver, in the form of chlorides. The separation of the liquor from the earthy matters sometimes presents considerable difficulty, owing to the presence of clay and of hydrated peroxide of iron, which is produced during the solution of the copper. This separation is effected by different means, according to circumstances. If the ore is sufficiently coarse, and free from slimes to filter well, the contents of the dissolving tubs are transferred to filter tubs and the liquor is allowed to drain out. If, however, filtration is not practicable, the stirrers in the dissolving tubs are stopped and raised, the earthy matters are allowed to settle and the clear solution is drawn off. In either case the ore is washed repeatedly—first with bath solution and then with water—till all the silver and copper is removed. Other arrangements are used in the cases of very poor ores, or such as can neither be filtered nor settled in a reasonable time.

The solution of copper and silver, freed from earthy matter, is caused to flow slowly through a series of vats or tubs, some of which contain metallic copper, which throws down the silver; the rest contain scrap iron by which the copper in the solution is precipitated. When the liquor leaves these vats it is again ready for use, being restored to its original condition—a solution of proto-chloride of iron and salt—with but little loss.

An important adjunct of the process is passing the sulphurous fumes from the roasting ore, or from burning sulphur, over the liquor in the dissolving tubs and other vessels, all of which are kept covered as much as possible to retain heat and keep out the air. The consumption of iron is less in this than in any other leaching process, owing to the fact that a large proportion of the copper is dissolved as dichloride, which yields twice as much copper for a given quantity of iron as does the sulphate.

Of course there are many details and modifications of this process to enter into which would be to write a book, which is not my present purpose; but I hope enough has been said to enable the reader to form an intelligent conception of a method of copper leaching, which appears to me well worth consideration by miners and capitalists as being adapted to use in this country.

The White Pine (Nev.) *News* says the Hamilton ladies shovel off enough snow to prepare a croquet ground, and then play that fascinating game clad in ulsters, overshoes, and fur gloves.

CORRESPONDENCE.

The "Pocket Mines" of Tuolumne County.

Rich Strikee—Eastern Investments—Live Companies, etc.

EDITORS PRESS:—Having in a previous lettsr told you something about the minss and mining industriss of Tuolnmne county in a general way, let ms now say a word or two concerning that particulsr class of deposits known as "pocket mines," of which there are a grsat many in this nsighhorhood. Thsse deposits occur only in quartz lodes, and are of a kind in which the gold is found collected in hunches instead of being disssminatsd throughout the ore-bearing mattsr generally. Pocket veins are not apt to be large, though some are met with of pretty good dimensions. Searching for these bunches or "pockets" of rich ore is a hazardous but exciting sort of business, since the miner may work a long time without realizing a dollar, while, on the other hand, there is a chance of his striking any day sometbing of great value. While tbese pocket veins are found in nearly all parts of the Cabfornia gold regions, they seem to be more numerous in tbis connty than elsewhere in the State, several of great richness having been discovered and worked in the immediate vicinity of this city.

The History of this Class of Mining

Takes us back to pioneer times, the first noted find of this kind baving occurred in Bald mountain, two miles north of Sonora, as early as 1852, baving been made by eome Mexicans wbo took from the pocket found there a great deal of gold, bow much, was never exactly ascertained. About the same time, and even before that, many large chispas were picked up in and along what ie known as the "Nugget helt," passing througb the southerly and central parts of this city, and which hae ever since been more or less worked. This belt derived its gold from a range of quartz veins running a little above, and wbich also gave to the Sonora basin its wonderful enricbment. Ever since the latter first began to be worked it has yielded a great many big nuggets, the number, of course, diminisbing with time, though this quartz range ie now being worked and affording, at some points along it, a great deal of gold. From

The Clark & Duvoll Claim,

Situate in the nortbwestern part of the town, and within the city limits, there have been taken out nearly $300,000 within the past eight montbs, only two of the three laboring men who own it, working in the mine, which for some time past has been closed up, for reasons known only to the owners. Encouraged by this strike, other parties have commenced sinking sbafts at different points along this lode all with eome, and about equal, chances of success.

Big Strikee and Cost of Production.

To go back a little, it may not be uninteresting to note eome of the more remarkable finds that have one time and another occurred, and the little cost that sometimes attends production in this line of gold mining. From what is known as the Morgan ground, on Carson hill, there were extracted many yeare ago gold to the value of $3,000,000, at a cost of not more than $5,000; from the Pedro claim, at about the same cost, there has been taken over $1,000,000; from the Ford claim $100,000—cost $4,000; from the Price $90,000—cost $7,000—the expense, aside from labor, attending the extraction of the large sum mentioned from the Clark & Duvoll location having been little more than the suhsistance of two men, price of tools, etc. Ae there was from this same claim taken out by two miners—Sedgwick and Van Pragg—$71,000, a long time ago, the probabilities are that it is not yet exhausted of its riches, these men having abandoned the ground in the belief that they had gotten out all the gold it contained. The claim cost the present owners only $50, eo little value was attached to it by the parties from whom they purchased not very long ago.

As would naturally be expected, the euccess tbat has attended this branch of mining has tended to encourage prospecting, and imparted new life to quartz operations generally, which, as already remarked, were never so active and promising in this county as at present.

Quartz Mille in the County.

There are now more than 20 quartz mills running in this county, with half ae many more making preparations, and nearly ready to start up.

Tbe following list includee most, but not quite, all the mines here on which qnartz mills have been built or are ahout to be erected, viz.: Confidence, 40 etamps; App, 25; Heslip, 15; Silver, 10; Quartz Mountain, 20; Rawhide Ranch, 20; Harris, 10; Hunt, 40; Golden Gate, 10; Big Creek, 10; Mount Jefferson, 10; Nonpariel, 10; Riverside, 20; Big Basin, 10; Hunter, 10; Ferguson, 20; Spring Gulch, 10; New Albany, 10; Golden Rule, 20; Soulshy, 20; Telegraph, 20; Daegner, 10; Louisiana, 8; Grizzly, 20; Consuello, 20; Star King, 5; Eureka, 10; Buchanan, 8; Raymond, 10, Patterson, 10; Excelsior, 10; Keltz, 20; Kelsey, 10; Atlas, 20; Evans, 5; Hazle Dell, 5; Little Gem, 10; Chandler & Beal, 4; Bear Creek, 5; Knox & Boyle, 10; Santa Maria, 10; Von Tromp, 5.

Altogether tbere have been put up as many as 600 stamps in this county, of the mills above enumerated, scarccly one-half are now in good condition, say about 250 stamps fit for active service. Many of these establishments never were well built nor efficiently eqnipped, while a large psrcentage of them have, for various reasons, hsen neglscted and fallen into a state of partial or utter decay. Of a large nnmber of these establishmsnts built bere in times past and afterwards entirely destroyed by firs, flood or other casualty, no msntion is above made. The arastra is much in use here, heing mostly employed for prospecting purposcs or run where the mines yield only small quantities of exceptionally rich ore. The building of quartz mills in this part of the country has heretofore cost at the rats of about $1,000 per stamp, except in cases of large and especially well-outfitted establishments where the cost has been more, sometimes nearly twice as much. As expsnses of all kinds connected with mining are now much less than formerly, a well-equipped quartz mill can at present he built here at an average cost of $600 or $700 per stamp, and where water is used for propulsive power, at eomething less.

When epeaking in my last letter to the PRESS concerning the operations and plans of

The Boston and Pacific Mining and Investment Company,

Organizsd for the purpose of prosecuting quartz mining in this county, it should have been stated that this company intend to carry on the business in a thoroughly eystematic manner and on an extended ecale, to which end they have not been content with the purchase of a single mine, but have at the outset secnred several properties of large and well-ascertained value. Not only so, these provident people have taken etcps to obtain additional mines, hoth by location and purchase; aleo forest and farming lande, it being their determination to provide against any possihle ore dearth after having once supplied their mines with reduction works, and, in short, to possess within themselves all the means and requirements eessential to making their enterprise a permanent success. They will have eeveral of their mines situated in juxtaposition or not far from each other, simultaneously devcloped, with a view to having reserves established at all times in one or more of them, thereby guarding against the occurrence of any entire failure of ore. This is a wise policy, and one that could be adopted to advantage in vein mining generally. With valuable water franchises, furnishing power enough to drive 100 etamps, with wood lands and farming lands, with groups of mines well opened and mills well equipped, and, finally, a first-clase management in the field, thie company is warranted in counting on a good outcome for their venture here. With their painstaking attention to business, their close figuring and habits of thrift, it may even happen that these New Englanders will beable to teach us old Cabfornians something about mining that would be well for us to know, and knowing, to practice. Wby should not our home companies, instead of relying upon a eingle lode or claim for tbeir ore supplies, possess themselves of several? And why should they not, where it is practicable, employ water instead of steam for orhoisting and crushing? And, furthermore, why not always take up or otherwise procure a tract of land to go with their mines? Water, timber and farming land will before long constitute valuable adjunots to these mining propertiee, and this company has evinced their sagacity in aggregating, through their agents, so many minee and so much land which, with their other appendages, make up one of the most complete and valuable estates to be foud in

OLD TUOLUMNE.

Sonora, May 29, 1880.

Long Perseverance Rewarded.

The Durango Mining Co., of N. Y. city, have heen for many years driving a tunnel to drain the Candelaria mine at San Dimas, in the State of Durango. For nearly a half century its valuable workings have been filled with water to the depth of 400 ft. In the various operations connected with this work, nearly a half million dollars have been expended, not counting interest. The water gradually siped away as the tunnel approached the old works, so that four monthe ago they were entered from above through the level of San Juan de Dios, and enficiently explored to justify fully tbe old traditions about their value. A few daye ago the resident agent of the company in this city, whose son, Augustus, is snperintendent at San Dimas, received from a younger son employed there a dispatch via Mazatlan saying: "Broke into tbe old works this morning, May 5th." The eteamer *China*, which arrived on Monday, May 24th, hrought the following graphic account of the excitement and rejoicing at San Dimas upon the consummation of this labor of years:

SAN DIMAS, May 10th.

Dear Father:—Yours of —— came to hand the other day. While you were writing, I was covering myself with gore and glory, and overloading my poor little mule with venieon. It being a great feast day of holy week, I was free to do as I pleased. We were all alone—that is to say "Muchacho," tbe dog, who is a terror alike to both deer and Mexicans, as he has a *penchant* similar to tbat of Artemus Ward's tiger, "Chiripa," the mnle, and myself. We came bome at night played ont; I with a terrible headache, "Muchacho" suffering from ovsreating and "Chiripa" from the revsrss. If you were a sportsman, I might tell you of our adventnres—how that old buck ran with a ball through his heart, till he dropped in his tracks stone dead; how the—but no, you are not a sportsman (mors's the pity), so I will spare you, and turn to a subject of more interest, *i. e.*, Candelaria.

I snppose ths mssgas you bave besn expecting so long, and that I sent on the 5th, has hy this time sped ovsr the wires to S. F., and thsnce to N. Y., advising all interested in ths property that the Candelaria tunnel is completed at last.

Of course you are anxious for details, but there are scarcsly any to give. We've done ths thing just as Gus said we would, and the miners tell me nothing could he better than the way tbe two headings have come together. The shot that did the business was fired from the old works. The moment the air whistled through the hole, all the bad air, that had been lying dormant in the nooks and corners, commenced circulating, and the last man up the shaft barely escaped with his life. The firing of rockets told me the work was finiehed some two bours before the messenger started for the coast with the dispatch. Whew! how we did clmb up the hill to the mine! "Penco" ran or trotted the whole distance, laying back his ehort eare and ehaking the bits epitefully each time I attempted to rein him in. Rockets hissed and cracked, the giant powder boomed and reverberated from the oppoeite cliffs, while all San Dimae was in the street looking at Candelaria hill.

We reached the mine and stayed only long enough to be assured there was no mistake, and immediately went down to find a *proprio* [special messenger]. I then sent to have the church bells rung, and the firing at the mine recommenced with the first stroke of the bell. With these cheery sounds in my ears, I wrote the dispatch, hargained with a swift Indian runner, and then went to dinner.

In the afternoon the miners came down in a body, bringing the crose from San Juan de Dios at their head. They halted outside the town and sent for the musicians, and then with music ahead, belle ringing, rockets firing and giant powder booming, they marched to the church, and tbere left the cross to be blessed before heing set up again in the tunnel. In the evening there was a grand ball in the plaza, with unlimited dancing and drinking, and that's the way we celebrated the completion of the great tunnel.

All that we have to do now is to lay the iron track, and begin taking out metal as fast as we want to. It is there, any amount of it.

A BRIEF HISTORY OF EUREKA.—Eureka has divided thrice as mnch money among etockholdere in its mines as it has gathered from them in assessments. It has done even better than thie. It has paid in dividends more than twice as much as bas been expended bere in the purchase of mines and in assessments together. The dividends have amounted to over $6,000,000, the assessments to a little lese tban $2,000,000. There has not eo far been expended more than $500,000 in the purchase of mines. Wo do not helieve that this record can be heaten by any mining district in America. With all its great out-put and the dividende paid thereon, Leadville cannot make euch a ehowing. It will take several years like the last for the gross yield to equal the amount paid for the pnrchase of mining property alone in that locality. If accounts are true there has been paid out in the neighborhood of $40,000,000 for mining property alone in Leadville since ite discovery. Allowing that $4,000,000 in dividends were paid last year it will take ten such profitable years to pay hack this money. Eureka's record stated briefly is this: Lese than $500,000 paid out for the purchase of the mines, and less than $2,000,000 paid out in assessments, hae reeulted in a grose out-put of over $60,000,000, and in dividends to the amount of over $6,000,000. Had there been one-tenth of the money expended in Eureka District in the purchase and development of ite mines, during the eight or nine years of its existance that there has hesn in Leadville in tbe past 18 months, our bnlbon out-put and dividends would have heen doubled. Instead of 8 or 10 eteam hoisting works (moet of those of limited capacity) we ought to-day to have 50 every one of them of sufficient capacity to prosecute the work of development to the depth of 3,000 feet. Inveetors have thought Bodie worthy the investment of $2,500,000 in assessments on a net yield in dividends of only $2,000,000. By the same rule Eureka is worthy of having at least $4,000,000 expended, more than it has yet received in developing its mines. One-half of this sum, if used with due economy and under wise direction, would result in douhling our bullion out-put and trebling the dividends of the dietrict.—*Leader.*

A NUMBER of years ago an escaped criminsl from Siberia discovered in the neighborhood of Schenkursh, in the provincc of Archangel, eand beds containing a large quantity of gold. He kept his discovery a secret, and only made it known last year on his death bed. A company for working the bede is already formed, and is at present endeavoring to obtain the concession.

Mono County Districts.

At Banton ths Diana company have hought or lsased ths Kerrick mine from tbe Vulcan company, and are now erecting hoisting works preparatory to working the Diana mins through the Kerrick. This addition of the Kerrick secures to the Diana company a property of "honanza" richness. The mill is heing put in excellent condition, so that as soon as the mins is rsady to resume work there will hs nothing to prsvent a long and prosperous run.

Clover District.

Clovsr district bas heen complstely shut out this winter, on account of the snow, which now happily is melting fast, so that in a short tims I anticipats good news from the many excellent prospects of which the district has scores. The Wild Rose mine, in spite of snow, has bsen worked all winter, and tbe tunnel is fast approaching the ledge.

Oneota District.

Ths Indian Queen mill will in all prohahility start in a few daye. They have been putting on men at the mine. Wm. Adams, who has been eo successful in the management of this property, will resume charge.

Indian District.

In the Indian district mines there ie at present but little being done. In my last letter I mentioned the negotiations for the Neal mine. The transfer has heen made, bnt how long it will he before work is commenced I cannot say. The Josephine mine, southeast of the Neal, is being prospected and some excellent rock taken therefrom.

Prospective.

Ae eoon as the snow melts off entirely we look for a rush of prospectors, as it is now well known that there are good claime in Indian and Clover districts, to be bad for the recording of them. With Candelaria booming to the east and Mammoth to the west, what can keep tbese rich minee from being found by men of means.—*Corr. Mammoth City Herald.*

A NEW DISTRICT.—A miners' meeting was held on Tuesday in Rough Creek Canyon, about five miles from Bodie, for the purpose of organizing a new district. It was decided that a mining district be organized to he known as the Drake mining district of Mono county, Cal., and that tbe boundaries thereof he as follows: The western boundary line of Bodie mining district to be the eastern boundary line of the said Drake district (heing ten miles in length); the northern and southern boundary lines to be ten miles in length, running at right angles with the eastern boundary line aforesaid, and the western boundary line to be ten miles in length and run parallel witb the said eastern boundary line. A recorder was elected to serve for the term of one year, and until the election of his successor, and he was authorized to appoint a depnty. The fees of the recorder were fixed at the following rates: For recording a notice of location of a mining claim, mill site, placer claim, or other papers, $3; for issuing certificatee of lahor, $3; for copying and attesting, or certifying, any record or paper in his office, $2. Many claims have been located and considerable prospecting is being done. There is much float quartz in the vicinity, and some prominent croppinge, bnt mostly barren. We hope, however, that "borasca on the surface meane bonanza helow."—*Esmeralda Herald.*

A LARGE BODY OF QUARTZ.—In the Alta mine on the 1950 level they bave drilled east a distance of 302 ft., etarting the drill hole in the face of a crosecut tbat ie 130 ft. in length from the main north and south drift. This gives a total distance of 432 ft. to which explorations have been carried eastward. The last 200 ft. of the drill hole was in quartz, giving low assays, and when the drill was stopped it was still in quartz. The drill might havc been run still further, but it has been withdrawn and a drift will now be eent in along the drill holc, as it has been found that there ie little danger of water. In all the drill tapped what amounts to three miner's inchee of water, which ie equal to 40 gallons per minute. To the west of the main north and south drift a crosscut has heen run a distance of 230 ft., without finding any sign of west wall. This crosscut starts from a point immediately opposite the crosscut and drill holo mentioned above ae running east. Thus at this point it is known that the vein is 662 ft. in width, without any indication of wall in either direction. In the vicinity of the north and south drift has heen opened a width of 26 ft. of base-metal ore that gives paying assays. The water recently struck to the eastward, in the drill hole, is hotter than any heretofore found in the mine, ite temperature heing 135°, whereas before the hottest has been 130° Fahr. It is hoped that the ore may have formed on the east side of the great body of quartz into which they have been drilling—probably out near the hanging wall—therefore they will now drift in that direction.—*Territorial Enterprise.*

BUILDING etone ie manufactured from furnace elag on a large scale at Osnahruck, Germany. One establishment delivered 6,000,000 hriok during the last year. The artificial stone is valuable for ventilation, as it permits four times as much air to pass as ordinary building etone; it also requires 20 times ae long to saturate the etone with moisture as it does bricks baked from clay.

MECHANICAL PROGRESS.

Benefits of Good Tools.

There is an old saying to the effect that "it takes a good workman to make a good job with poor tools." So it does, and there have been many triumphs, recorded and unrecorded, of brain and skill over seemingly insurmountable obstacles. It is a satisfaction to compass a result with apparently inadequate means, and the mechanic who does it is justly proud of his success. But working with poor tools is never certain to produce good results, however great the skill and inventive the brain. Misses are made as well as hits, and even the most self-assured workman feels safer with good and applicable tools. No workman can afford to risk his reputation and success with poor tools; there is so much risk of a failure and such anxiety for the result, that even if success is attained it has been at the expense of time, thought, muscle and trouble that robs it of half its gratification.

The time has gone by when the workman was expected to "make something out of nothing;" when one implement or appliance was made to do duty for another, and "make-shifts," their origination, use and application to the job in hand were part of the kit of the workman. The constant and growing improvement in tools and labor-saving machinery has not only increased the profits of the manufacturer, but lightened the labors of the workman. The machinist who learned his trade 30 years ago would now be ashamed to resort to the wretched substitutes of tools with which he was then compelled to do his work. The carpenter knows the advantages of the mortising machine, the molding machine, the band-saw and other improvements. The blacksmith sees the advantages of the drop-hammer, the shears, the steam-hammer and the portable forge; and even the farmer, who keeps up with the times, appreciates the mowing machine and the many improved hand-tools which facilitate his operations and reduce his labor. There may have been brain energy and labor wasted in the production of improved tools and appliances; for there are some which have never met the expectations of their contrivers or filled the wants of the users. But in truth, there has been no portion or department of mechanical endeavor that has accomplished better results or reached higher success. The number of special tools now used is wonderfully great as compared with 30 years ago. There is no manufacture of consequence that has not its special appliances, machinery and tools, and in tools for general work the improvement has been fully as marked. Even in hand-tools the improvement is obvious to the slightest observation. In every department of industry these improvements have made their mark. They save time and labor, and produce more satisfactory results. It is a wise economy to reject imperfect tools, and, as the patent-medicine men advertise, "use the best." Whenever an improved implement is put into the market—one that will do the work better or quicker—it is economy to buy it, even if the old one is intact and serviceable.—*Boston Journal of Commerce.*

A NEW MEASURING IMPLEMENT.—A remarkable machine was described at a recent meeting of the Societe d'Encouragement pour l'Industrie Nationale, at Paris, called profilograph, because when in use it traces mechanically on paper the outlines of the ground over which it travels. It is described in one of our foreign contemporaries as a small carriage mounted on two wheels, drawn by one man and attended by another, who marks the levels at the proper places; and underneath hangs an iron rod with a large ball at its lower end, serving as a pendulum. This pendulum maintains a constant vertical position, while the machine inclines in one direction or the other according as it ascends or descends a slope. To the upper end of the rod is fitted a pencil, which marks on a sheet of paper the ups and downs of the country traversed, whether on an ordinary road or across trackless fields. The exact profile is thus recorded to a given scale. At the same time one of the wheels, acting the part of chain bearer, measures and indicates the distances traveled throughout the survey. For surveyors and others engaged in leveling operations, this machine would appear to be eminently serviceable, and there is talk of its being made use of in a new general survey of France contemplated by the government.

AN IMPROVED CATTLE CAR.—A St. Louis man has patented a new cattle car. The peculiarities of the invention consist in placing the stock in four racks lengthwise of the car. The racks in each end of the car stand facing each other, and a combination water-tank, trough, and hay-box extends crosswise the car and under the heads of the cattle. Chains or belting fastened to the floor pass up between the stock and are attached to a shaft overhead, which, being turned, draws them tight and holds each animal in place. Water and feed is carried for a trip of four days, and stock can eat, drink, lie down, and rest without the train stopping. Reversing the shaft the stays fall off and drop down. The water-tank is on a roller, and can be easily moved to the end of the car. The car is then ready for any kind of freight.

Alloys of Iron.

M. Pourcel, at the late meeting of the British Iron and Steel Institute, said: Tungsten alloyed with steel appears to harden without detracting from its toughness, but I doubt much whether the advantage gained compensates for the cost. Tungsten is also said to add to the magnetic power of steel, but of this I have no experience. In steel supplied to a Cornish mining company from Sheffield for borers, I found as much as 10% of tungsten. As far as fracture goes, this alloy is the most beautiful of all steels.

I have no experience as to the effect of tin on steel, but a bar of iron made from tin-plate shearings, from which the tin had been to a considerable extent removed, was extremely red, short and unweldable; the amount of tin contained in this sample was 0.15%. Lead and zinc, when added to a bath of steel, are simply volatilized, without producing any effect except that of half choking the melters.

Chromium gives great hardness, but at the same time causes brittleness, and may be put down as useless.

The effect of copper upon steel seems to be greatly exaggerated in most metallurgical works; it is generally stated to cause more red shortness than the same amount of sulphur. In some experiments made at Landore, it was found that 0.10% of copper produced no appreciable effect on the quality of steel; and even when the amount was increased to 0.30%, only a slight cracking on the side of the bloom was observable. This question is, perhaps, more important than appears at first sight. One possible difficulty that soft steel manufacturers will have to contend with will, no doubt, be the scarcity of manganese ores suitable for the manufacture of ferro-manganese, and many good ores might be rejected on account of the presence of copper, a very frequent companion of manganese. At the present time ferro-manganese containing 5% of copper would certainly be unsalable, although, in my opinion, it could be used with impunity.

In conclusion, I may remark that any comparisons made by me of the merits of the two great processes for making steel—*i. e.*, the Bessemer and Siemens—would doubtless be considered prejudiced; but I believe it is now generally conceded that for soft steel the latter carries off the palm, and this I attribute to the complete elimination of the silicon, to the mixture of different brands of pig, and to the absolute certainty with which the carbon in the finished steel can be controlled.

Molecular Changes in Iron and Steel Wire.

A novel and important communication has been made by Prof. Hughes, the well-known inventor of the microphone, to the Society of Telegraph Engineers on the molecular changes which take place in iron and steel wire. He discovered, accidentally, about a short time since, that iron or steel wire, after being dipped for a short time, say two minutes, in a solution of sulphuric acid and water, becomes exceedingly brittle and will not bear bending, the metal becoming "rotten." This is not due to mere corrosion of the surface or skin of the metal, because the wire broke even after the outer layer had been carefully removed. The brittle wire shows no change of magnetic conductivity when tested by the induction balance, such as would be the result of heating, straining, tempering or corroding. There is reason to believe that the suggestion made by Mr. A. Chandler Roberts, that the brittleness is due to absorption of hydrogen by the iron, is the true cause of this peculiar phenomenon. If the wire is immersed in very weak acid, it takes about 30 minutes before it is brittle; when, however, an amalgamated zinc plate is dipped into the same solution and connected to the wire so that a voltaic element is formed, giving off abundant hydrogen at the surface of the iron, the full effect is produced in a minute, owing apparently to the absorption of the hydrogen by the wire. In the latter case, too, the presence of the zinc protects the iron from the action of the acid, and, therefore, demonstrates that the brittleness is not due to a mere surface corrosion. Mr. A. Chandler Roberts has heated the brittle wires of Prof. Hughes in vacuo, and has found that they occlude or absorb about twenty times their volume, irrespective of the "natural gas" in the metal, which amounts to from three to ten volumes of hydrogen and carbonic oxide.

THE *Engineer* says that two Germans have made a new form of machine for separating the turnings and borings of brass and copper from those of iron and steel. The mixed metals fall upon a magnetized drum, to which the iron and steel adhere, leaving the copper and brass to fall into a special reservoir below. There are two cylinders rotating in the same direction, so that the iron which escapes from the first cylinder is retained by the second. The surface of the cylinder is formed by flat hands or strips of soft iron, alternating with strips of copper, and each of the iron bands is in contact with a row of horse-shoe magnets. The adherent metal is removed by revolving brushes.

RAWHIDE is said to make good journal boxes. A practical machinist says: "I have run a piece of machinery in rawhide boxes for 14 years without oil; it is yet good and runs at 4,500 revolutions per minute. I put it in while soft and let it remain till dry."—*American Machinist.*

SCIENTIFIC PROGRESS.

Cutting Cold Steel With Soft Iron.

The development of heat by friction has been long known. For some time it has also been known that the operation of rolling and rubbing had the effect of changing the molecular structure of iron and steel. These operations will toughen and compact cold iron, and will harden and condense steel. Some time since Mr. Jacob Reese, of Pittsburg, Pa., had occasion to construct a machine for cutting bars of cold hardened steel. For this purpose he mounted a disc made of soft wrought-iron upon a horizontal axis, so as to be rotated with great velocity. With any moderate speed no cutting was produced. But, on giving the disc such a speed of rotation as to cause the periphery of the disc to move with velocity of about 25,000 ft. per minute (nearly five miles,) the steel was rapidly cut, especially when the bar to be cut was slowly rotated against the disc. Sparks in a steady stream were thrown off. At first it was supposed that the steel was simply rubbed or ground off; but on examining the pile of accumulated particles beneath the machine, they were found to be welded together in the shape of a large cone, similar to the stalagmites in the limestone caves; they were nearly like the spikes of frost as formed in winter on Mount Washington, and illustrated at Troy meeting. Real fusion takes place. The steel is melted by the swiftly-moving smooth edge of the soft iron disc, but the disc itself is but little heated. The bar of steel on each side of the cut receives but slight heat, and the ends are left with a fine smooth blue finish. By this process a rolled, polished and hardened steel bar of two or three inches in diameter, may be cut in two in a few minutes. The soft metal disc of iron used was about 42 inches in diameter and three-sixteenths of an inch thick. The particles fly off in a thick jet of steam apparently white hot, through which the naked hand may be passed without injury, and a sheet of white writing-paper held in the steam for a minute is not burned nor colored in the least. They glance off without burning the hand, having assumed the condition which causes the spheroidal state of liquids.

The explanation of this curious phenomenon lies in the fact that the very rapidly rotating iron disc causes great numbers of particles of iron to come in contact with comparatively very few particles of steel, every particle of which has to withstand the impact of thousands of iron particles; it thus gives way to superior numbers, this impact at the same time developing heat enough, not only to melt the detached particles of steel, but to bring in the spheroidal state.—*Manufacturer and Builder.*

Why the Needle Points in a Northerly Direction.

Prof. Patterson, Superintendent of the United States Coast Survey, writes as follows in answer to an inquiry by a gentleman as to the reason why the needle points in a northerly direction:

DEAR SIR:—Your note is duly received, and in answer I beg to state that the reason why the needle points in the northerly direction is that the earth in itself is a magnet, attracting the magnetic needle as the ordinary magnets do; and the earth is a magnet as the result of certain cosmical facts; much affected by the action of the sun. These laws have periodicities, all of which have not as yet been determined.

The inherent and ultimate reason of the existence of any fact in nature, as gravity, light, heat, etc., is not known further than that it is in harmony with all facts in nature. Even an earthquake is in perfect harmony with, and the direct resultant of the action of forces acting under general laws.

A condensed explanation in regard to the needle pointing to the northward and southward is as follows: The magnetic poles of the earth do not coincide with the geographical poles. The axis of rotation makes an angle of about 23°, with a line joining the former.

The northern magnetic pole is at present near the Arctic circle, on the meridian of Omaha. Hence the needle does not everywhere point to the astronomical north, and is constantly variable within certain limits. At San Francisco it points about 17° to the east of north, and at Calais, Maine, as much to the west.

At the northern magnetic pole a balanced needle points with its north end downwards in a plumb line. At San Francisco it dips about 63°, and at the southern magnetic pole the south end points directly down.

The action of the earth upon a magnetic needle at its surface is of about the same force as that of a hard steel magnet, 40 inches long, strongly magnetized, at a distance of one foot.

The foregoing is the accepted explanation of the fact that the needle points to the northward and southward. Of course no ultimate reason can be given for this natural fact any more than for any other observed fact in the nature.

C. T. PATTERSON,
Supt. U. S. Coast Survey.

LIME has never been found in a native state; it is always united to an acid, as to the carbonic in chalk. By subjecting chalk or limestone to a red heat it is freed from the acid, and the lime is left in a state of purity.

A SHOWER OF IRON.—Prof. Silvestroke, of Catania, has reported the following interesting particulars concerning a phenomenon lately observed in Sicily: During the atmospheric disturbance in the month of March, 1880, the influence of which was felt in Sicily, with rapid variations of the barometer, there was observed in Catania, for a few hours during the night of the 29th to the 30th March last, a fall of meteoric dust, accompanied by rain. This dust, besides having the red color, mineral and organic particles and minute infusoria frequently observed before on similar occasions, was this time especially interesting, because it contained a considerable quantity of iron, either in a pure metallic state, or in metallic particles surrounded by an oxydized crust. The fragments were of sizes varying from 1 to 10 hundreds of millimeters; some were of an irregular, others of a perfectly spherical shape, as if they had been suddenly fused. All were immediately attracted by the magnet. This fact (discovered for the first time in dust gathered on board a ship in the Indian ocean on the night of the 24th to the 25th of January, 1859, and afterwards confirmed by the illustrious Prof. Nordenskjold on the *Vega* in the Arctic and other seas) is of immense importance to physical and geological science, as proving that iron, which is not known in a pure metallic state on the surface of the earth, is to be regarded as of extra-terrestrial or cosmic origin, establishing a link between the earth and the chaotic material dispersed over the universe; and as being in strict relation with the phenomena of aerolites and meteors. In conclusion, it may be remarked that the dust which fell in Sicily only differs in the size of its metallic particles from a shower of aerolites.

ETCHING ON COPPER.—M. Leon Vida writes to the *Photographic News* as follows: "My attention has lately been drawn to a new process for the production of line or stippled drawings, and as it seems to me to be worthy of notice, I give a short description of it: A copper plate is first coated with bitumen on the turning table, in the same way as in photo-zincography, and when the bitumen is quite dry, an impression from a lithographic stone on transfer paper is applied to it. When this paper is removed, we have a copy of the impression in fatty ink on the bitumen surface. This surface is then dusted with fine bronze powder, which adheres to the inked portions, and renders them quite opaque. If, now, the surface be exposed to the light, the bitumen not covered by the powder will be rendered insoluble. On the plate being placed in some solution which dissolves the bitumen, the copper will be laid bare in the parts not acted on by light. These parts can then be etched in by a concentrated solution of iron perchloride, and when the depressions are sufficiently marked, the action of the mordant is arrested, and all the undissolved bitumen is removed. We have in the end an intaglio engraved plate. This process is very well adapted for line or stippled drawings, but it will not answer for the production of those with half tones."

TYNDALL'S DEFINITION OF THE BRAIN.—The human brain, according to Prof. Tyndall's recent definition, is the organized register of infinitely numerous experiences received during the evolution of life, or rather during the evolution of that series of organisms through which the human organism has been reached. The effect of the most uniform and frequent of these experience has been successively bequeathed, principal and interest, and have slowly mounted to that high intelligence which lies latent in the brain of the infant. Thus it happens, says Tyndall, that the European inherits from 20 to 30 cubic inches more of brain than the Papuan; thus it happens that faculties, as of music, which scarcely exist in some inferior races, became congenital in those that are superior; thus, too, it happens that out of savages unable to count up to the number of their fingers, and speaking a language containing only nouns and verbs, arise at length Newtons and Shakespeares.

TO ASCERTAIN THE MOLECULAR CONDITION OF METALS.—A new and most sensitive instrument for ascertaining the molecular condition of metals has lately been placed in the hands of metallurgists, in Prof. D. E. Hughes' "Induction-Currents Balance." A description of this instrument will be found in the Proceedings of the Royal Society for May, 1879 (vol. 29, page 56). By its means it is possible to detect extremely minute changes of structure, and to compare unknown specimens with any desired standards. In investigations connected with the molecular conditions of steel and other metals, chemical analysis is of comparatively little value, and is at best difficult, tedious, and costly to perform; whereas Prof. H.'s instrument appears to afford the means of detecting not only chemical, but also structural changes of very small amounts.

HOW BIRDS SING.—It seems difficult to account for so small a creature as a bird making tones as loud, in singing, as an animal 1,000 times its size. But it has been discovered that in birds the lungs have several openings communicating with corresponding air bags or cells, which fill the whole cavity of the body from the neck downwards, and into which the air passes and repasses.

The Mining Share Market.

There is no noticeable change in mining shares since our last issue. The Boards adjourned on Saturday until Tuesday, and it was reasonably expected that there would be an accumulation of orders during the long interval. This expectation was realized in a measure, for the transactions of Tuesday were large, particularly in the north end shares. Since then both transactions and prices have gradually declined. The advices from the mining districts continue to be favorable, and the indications for a development in one or two of the leading Comstock mines appear to grow better from week to week. When the long-hoped for news does comes it will be an agreeable surprise.

Important discoveries and strikes continue to be announced. Not the least interesting of these come from the quartz and gravel mines of California, and it must be conceded that the mining situation is brimful of promise.

ACTIVITY IN RAILROAD BUILDING.—The construction of railroads in the United States has received an immense impulse since the revival of general business. Few of our readers, we venture to say, have any adequate conception of the magnitude of the work that is doing in that field. The N. Y. *Bulletin* states that, since the 1st of Sept. last, and up to the 25th of March, nearly 3,000 miles of new road had been constructed, and no less than 12,641 miles of new road projected. The same rate of progress continued during the remainder of the present year, would bring the figures of railroad construction very nearly, if not quite up to those of the extraordinary years 1871 and 1872, immediately preceding the financial crisis of 1873. If, however, the country should experience no financial derangement during the current year, there is little doubt that the larger part of the new undertakings referred to, will be carried well forward. They will greatly increase our transportation facilities and the distribution of population, commerce and industry.

A PARTY of colored people have returned to Georgia from Liberia, and they pronounce that "promised land" of their race a delusion and a snare. An industrious colored man is better off in the United States than any where else in the world.

The Felton Railroad Disaster.

The coroner's inquest into the causes of the recent fatal disaster concluded its labors, May 31st. The jury agreed as to the number and description of the dead, but disagreed on the important question of the cause, and presented three reports. The first report gives a synopsis of the voluminous evidence, and then proceeds as follows:

"From the foregoing facts we make the following findings: First, that the Gen. Supt. of the road is blamable for the make-up of the train, and intrusting it to men, young, and to some extent inexperienced, neither of whom in the discharge of such duties, had before passed over that section of the road in charge of a train; second, it is difficult to find what an engineer in charge should have done in such an emergency, bnt from the testimony we believe that he did not handle his train with the skill of a more experienced engineer; third, we believe that the train officers did not exercise that care and prudence they should have done cousidering their want of knowledge of the road, the condition of the same, and the heavy grade they were descending; fourth, we believe that all persons who had charge of the road in maintaining its alignment and grade are blamable for letting that sharp curve remain on that section of the road without having notified the train men, and thereby have avoided the probability of an accident." This conclusion is signed by Elihu Anthony, T. W. Wright and E. Bernheim. The second report is without any preliminary remarks, and has the followiug: "We, the undersigned jurymen, do futhermore find and return that, according to the testimony given in evidence before us, said accident resulted from nnforeseen causes, and that the same are to us unknown." This is indorsed by John C. Toll, P. E. Tilden, Silas Felker, Chas. S. Eastman and J. A. German. Benjamin Knight, Sr., makes a brief *resume* of the testimony, and concludes by saying: "I find that the acting engineer was incompetent for want of knowledge of the road, and short experience as an engineer; and I further believe that if there be blame to be attached to anyone or more persons, it should be investigated and determined by the Courts."

THE oldest living graduate of Harvard college is said to be Joseph Head, who was graduated in 1804.

MINING SUMMARY.

This following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MINING NOTES.—Amsdor *Sentinel*, May 26: Ths Newton copper mine appears to bs prospering. The mssons are at work on 10 new roasting pits. Ths Stewsrt & Gillick mine, at Volcano, bas besn finslly sold to Lyls & Co., of S. F., for $30,000. At Olets the Jupiter mine, at a depth of 55 ft, bas a ledgs 5 ft wide of free gold-bearing ore, which, by mill process, shows $51 to ths ton. A new shaft is being sunk near tbe Zeils mill. The lead was discovered wbile ths mill was helng built. The contract is for sinking 50 ft, at $9.50 psr ft.

BUTTE.

HEAVY BLAST AT CHEROKEE.—*Mercury*, May 28: Supt. Waldyer fired a big blast in ths works of the Spring Valley Hydraulic Gold Co., at Cherokes, Monday. Ths charges consisted of 25,000 lbs of Judson powder. Two shafts were sunk to a depth of 125 ft each, from the hottom of which a T extended 40 ft each way into the mountain. At ths ends of ths T's 6,500 lbs of ths powder was deposited; an electric wirs ran from each chsrge to ths surfacs, whers connection was made with ths msin wire running from ths instrument. The T's and shafts were tightly packed with dirt. At 11 o'clock ths signal was givsn Louis Glass to striks ths electric spsrk. Instantsneously tbe facs of the mountain, which was about 250 ft high, raised upward and outward for a distance of 300 ft back from tbe face and settled in a thoroughly demoralized condition. A low rumbling noiss accompsnied ths explosion, and a hugs cloud of dust arose as ths enormous mass partially toppled and fell onto the plateau in front. At a distance of 500 ft back from ths shafts, on the top of the mountain, gigantic osk trees tremhled liks aspen leaves, the earth seemed to psrties standing on it to raise upward about 1 ft, and the shelving table rocks jlngled together liks dice in a box. Competent judges estimate the amount of dirt loosoned and displsced by ths explosion at 500,000 cubic yards. The success of ths blsst is perfectly satisfactory to the muagement and exceeded their expectations.

STRUCK A BONANZA.—W. W. McMillan, of Evansville, has for years devoted his spare time to prospecting in ths strip of country lying bstween Bangor snd Boeton Ranch. His efforts were last week crowned with succes, he finding a ledgs of rich quartz. Thres tons of the rock were crusbed, the result being a yield of $200. The vein is six inches in width.

CRYSTAL HILL QUARTZ LEAD.—*Register*, Msy 29: Mr. Wagonsr, who for ths past two years has been prospecting what is known as Crystal Hill quartz lead, in Mountain Spring townsbip, has his mill now running and crushing rock taken from this lead, which yields sufficient returne as to justify him in continuing work. It is his intention to build another mill, nearer the claim, and open the mine in ths best possible manner. The richness of this quartz has never besn a question, but in all previous attempts at working the rock the parties have been unable to save the gold.

CALAVERAS.

BOSTON MINE.—*Chronicle*, May 20: The work of hsuling the lumber for the 25-stamp mill to he erected on the Boston mine, in Buckeye gulch, is in progress, and the work of putting up the mill will he commenced this week.

EL DORADO.

PLACERVILLE G. Q. M. Co.—*Republican*, May 21: It takes money and time to open a quartz mine. The Placerville G. Q. M. Co. kept a force steadily at work over a year before 1 lb of rock was worked, and nearly two years before they built a mill, but the result was a three years' supply of ore in sight for 20 stamps.

ANOTHER MINE SALE.—The mine formerly known as the McNulty and the Tingman, now known as the Electric, near the old Springfield mine, Mud Sprngs township, has been sold to F. Tagliahue and others of S. F. This mine is upon the mother lode, is now down a littlo over 200 ft, and $156,000 bave heen taken out since it was first opened. There is a quantity of fine ore already out. The mill will he started up at once.

SARDINE MINE.—Greenwood Cor. *Republican*, May 21: Mr. Thos. Simous is making good headway with the shaft; the rock still is very hard, hut breaks out much hetter than it has hitherto done, and Mr. S. tells me that he will very shortly he able to commence drifting for his pay gravel. The river is high, and will be so till well into the summer.

MINING NOTES.—The claim holders on the seam bclt, north of the Bower mine, are busy prospecting their several locations; notably so Messrs. Jacob Nagler and John Smith, who have just put in a new flume, pipe, etc., and now have their mine in good order; and also Mike Muntz & Co., whose prospects are amongst the best; while Mr. Van Bremeu's claim is being actively operated as usual.

MINING NOTES.—*Mountain Democrat*, May 29: Prof. Price, with a corps of engineers and workmen, has been husily engaged in laying off the ground and preparing for the erection of works and the prosecution of active mining operations at the Epley mine, near Ringgold. The P. G. Q. Co.'s fine new mill is steadily crushing from 30 to 35 tons every 24 hours, of ore that is of extremely uniform quality, averaging about $18 per ton. The negotiations are about concluded for the transfer of the immense gravel deposit at Diamond Hill to an S. F. company of abundant means. Griffith and Hart are pounding away at a lively rate, and with satisfactory results, in their newly-erected mill near Nashville, on ore from their Montezuma mine.

ROSE.—This mine is turning out its regular quota of good ore, a large portion of which appears to he of high grade.

GRIFFITH CON.—Slowly hut surely the pumping apparatus is gaining on the inflow of water at the Griffith Con., and within a short time that large and rich ledge will he in a condition to yield rich returns.

OLD HARMON MINE.—Mr. Plaisted, the recently arrived representative of the Eastern company that bought the Old Harmon and adjacent mining properties, is engaged in methodical preparatious for working those mines.

INYO.

DEEP SPRING DISTRICT.—*Independent*, May 22: There are now about 20 prospectors in Deep Spring district, and locations of promise are being made daily. As yet, however, it is a prospector's camp, no permanent work having been commenced. Operations are of an exploratory nature, in distinction to work of development. Many of the prospectors are interested in more than one claim, and are engaged in doing the necessary work to hold the various claims; consequently the development of the district is retarded.

DEFIANCE FURNACE.—The Defiance furnace commenced running last Monday on ore from the Custer, taken out by Gorman & Eddy, and has produced about 10 tons of bullion every 24 hours. The New Coso commenced running on the same date, and is making a splendid run.

ITEMS.—Billy Lake, who left here some two weeks ago to do some prospecting in the White mountains section, has succeeded in discovering a 3-ft ledge of average grade silver ore. It is pleasant to note that two of the Darwin furnaces are once more in full blast.

MONO.

DRAKE DISTRICT.—Bodie *News*, May 25: On Sunday last our reporter visited the scene of the latest excitement, Rough creek, now called Drake mining district. This is a new district lately organized in order to avoid all doubt as to the district in which these mines are located, there being some dispute upon that point. Rough creek, in a direct line, lies about 3½ miles from Bodie. The country has the appearance of a fine mineral-bearing region. The ledges are large and crop holdly above the surface, and can he readily traced for miles. A singular and promising feature of 18 ledges, from which the reporter with his

pick took samples from the croppings, showed free gold, while the same rock by assay went from $30 to $200 per ton, 60% silver. Bodie is well represented in this new district. There have been 27 claims recorded. The locating of several claims by the same parties is wrong. It is always this spirit of greed that holds in check the development of any mining camp, and the laws of the district should make provisions against this serious drawback.

DIANA MINE.—*Bentonian*, May 17: At the Diana mine everything is bustle and activity. By the end of this week the roads leading to the new hoisting works will be completed, the foundation for the engine house graded, and perhaps the shaft, being raised from the Kerrick, will be finished. At 6 o'clock this morning another body of rich black ore was struck in the shaft being raised. This rich vein of ore is from 3 to 12 inches in thickness, and lies probably less than 40 ft from the surface.

WHITE ROSE MINE.—A solid body of ore has been struck in the head of the tunnel and about 60 ft below the bottom of the shaft. This body of ore has been penetrated a distance of 5 ft, and there is no evidence as yet that it has been passed through.

INDIAN QUEEN.—Mammoth City *Herald*, May 22: Wm. Adams, Jr., has been paying Lake district a visit, and from him we gather the following items of interest as to what is being done in that section: Tunnel No. 5 of the Indian Queen is now in about 1,500 ft; it intersects and follows the vein at a vertical depth of about 500 ft. The ledge is well defined and most of the distance stands at an angle of about 25°. There is on the dump about 40 tons of the usual quality of high-grade ore; there is also exposed about 600 tons more. The mill will be ready to start about the 1st of July, with a good prospect for a steady run all season.

LAKE DISTRICT.—*Herald*, May 20: In the Mammoth during the past week 34 ft were driven, giving a total length of tunnel of 1,383 ft. The ore dump has been moved down the side of the hill from No. 2 to No. 3 tunnel, and the tramway is now being overhauled and put in working order. The air compressor and Burleigh drills will be started up again in a few days, and work resumed in No. 3 tunnel. An upraise will be started to prospect and ascertain the extent and value of the body of decomposed ore found in the Hardy winze. A regular system of crosscutting the ledge at short intervals will soon be inaugurated in No. 4 tunnel, which will give an exact knowledge of the size and value of this remarkable ore fissure.

LAST CHANCE.—The McCarthy Bros. and Jas. Patterson have the Last Chance shaft down 30 ft, and they expect to be in their ledge in about 15 ft. Assays of ore taken from near the croppings of this ledge last year went as high as $78.

U. L. & M. C. JOINT TUNNEL.—Everything is running along smoothly about these works. The rock is still hard. Distance made since last report, 56 ft; total length of tunnel, 756 ft.

GENEVA.—Jas. Argall and Clint Joyce have commenced work in earnest on the Geneva mine. They have their tunnel in 42 ft, and expect to strike the ledge in about 20 ft more.

MARIPOSA.

VIRGINIA MINE.—Coulterville Cor. *Gazette*, May 28: The Virginia, formerly known as the Captain Aiken mine, is about 4 miles southeast of Coulterville, and is now the property of Mr. J. W. Coe, of N. Y. Mr. C. purchased the property last Sept., and has since erected an 8-stamp mill on the mine, which has within the last 00 days, with actual running time of 35 days, produced at least $20,000. In the main shaft, which is down about 80 ft, they have, in the past 24 hours, made a wonderful find in the vein of gold in large flakes and stringers, from which, as I am informed, they have taken out at least $10,000.

POTOSI AND MALVENA MINES.—The Cook Bros. are running a tunnel on the Potosi, adjoining the old Malvena mine. Twenty years ago the Malvena was deemed to be rich with gold and considered very valuable. The same company is sinking on the Malvena No. 2, with an encouraging prospect before them.

BANDERITA.—Mr. P. P. Mast is running a tunnel from the Banderita mill to strike the vein 400 ft below the old works. It will, when completed, be about 1,500 ft long. The Banderita is one of the permanent paying mines of this section.

MARTIN & WALLING.—Mr. Mast is also owner of the Martin & Walling mine, which is well established and generally conceded to be a first-class mine. It is worked from a shaft sunk on the vein about 300 ft deep by a 40-horse power engine attached to the hoisting works, which has just commenced operations.

MINING PROSPECTS.—Stockton *Independent*, May 29: Senator Pool, of Hornitos, is in town, and reports the mining interests of Mariposa county booming. Capital from the East and elsewhere is taking hold of Mariposa mines. A N. Y. company, owning the No. 0 mine, about 2 miles from Hornitos, has put up machinery and is beginning work on a large scale. At the Pool mine, about 1½ miles from Hornitos, a new American arastra is crushing about 10 tons of rock daily, and paying handsomely. A S. F. company has taken hold of the Silver Lead, and is erecting new machinery, and a good account is expected of the rock now on the dump. The Senator also informs us that he has it on good authority that a settlement has been arrived at concerning the Fremont grant, and that the company will, in a short time, either grant leases or work the mines on the grant themselves.

NEVADA.

MEADOW LAKE.—Truckee *Republican*, May 20: Those who have held to their locations in Meadow Lake through all its ups and downs are now more than ever confident that they have a good thing. There is going to be a revival in the mining interest there this summer. A company of gentlemen from this place, who own a mine there, worked 12 tons of rock last season and obtained $1,800 therefrom by mill process. They simply roasted the rock before crushing, and had no difficulty whatever in extracting the gold. They propose working extensively this summer as soon as the snow disappears. They feel confident that a number of the mines in that locality will prove equally as valuable when worked in the same manner. We learn by letter from Hon. James Wasson that the State Mineralogist is likely to put a man in the field there to investigate the character of the veins and their formation some time this summer. There are some capitalists of S. F. also propose to prospect quite extensively there this summer.

QUARER HILL.—Dutch Flat *Forum*, May 20: At this new mining camp the mining interests are reported to be in a prosperous condition. Sargent & Jacobs are employing about 20 men. Last week a tunnel, 20 ft below the upper one, was started, and about 50 tons of gravel are moved daily. This is taken from the mine, hoisted through the shaft and crushed at an expense of about $1.50 per ton. Some of the cement taken from the mine pays as high as 25 cents a lb. The new shaft, it is believed, will disclose some very rich gravel, as it extends along a bar of an ancient river channel. The machinery is all driven by water power, there being 3 hurdy wheels in operation—1 for hoisting the gravel, another for milling and 1 for pumping, the latter is kept constantly running. The company has a hydraulic mine close by which employs about 20 men, and is kept in constant operation.

BANNER MINE.—Nevada City *Transcript*, May 27: Although about 40,000 shares of the recently-incorporated Banner quartz mine of this district have been disposed of in the East, the principal owners here are now making an effort to withdraw the property from that market and recommence work on the claim with the aid of local capital alone, and have instructed the N. Y. agent to recover the stock already issued, if it can be accomplished, by paying a reasonable bonus. A little experience has shown that the laws of N. Y., under which the incorporation was effected, are not so well calculated for speedy and effective operations as those of this State; furthermore, the Banner has such a good reputation that there are several moneyed men in the vicinity who are anxious to take hold of it with their neighbors.

SAILOR FLAT.—The Sailor Flat company, whose hydraulic mine is at Blue Tent, came to town yesterday with $10,000 worth of bullion. This was a partial clean-up after about 450 hours run on top dirt with 2 monitors. The company has not yet worked any of the bedrock in its claim, and is said to have the richest top dirt to be found anywhere in the State, excepting that around Columbia Hill, in this county.

SOUTH IDAHO.—Grass Valley *Union*, May 21: This mine is about 300 yards southeast of the Idaho, and a shaft has been sunk which strikes the ledge at a distance of 75 ft from the surface. The ledge is about 7 or 8 ft in thickness, and carries gold and plenty of sulphurets. The mine is owned by Grass Valley and S. F. parties, and it is understood that a contract will soon be let to sink the shaft 100 ft deeper and crosscut at that point through the ledge.

PLACER.

EMPIRE MINE.—*Foothill Tidings*, May 20: The engines are at work at this old mine. The owner, W. H. Bourne, of S. F., was here this week, and it is understood that the mine will be relieved of water to the bottom, below the 11th level, and the main incline be continued downward. This is the oldest steady-paying mine in Grass Valley, and we are glad to note this resumption of work.

CONRAD MINE.—*Argus*, May 29: Messrs. Roberts, proprietors of the Conrad mine, are doing splendidly. They lately finished a 3-ft. run at Salmon & Pelster's mill—which they have leased for 3 months—and cleaned up nearly $2,200, an average of $100.50 per ton.

CRATER MINE.—The Crater mine, at Ophir, 4 miles from here, has taken out over $53,000 in 4 months, and it is now said to be doing even better than that. There are between 30 and 40 men employed there.

THOAP & CO.'s shaft, on Duncan hill, adjoining Roberts & Co.'s claim, is down 215 ft on the ledge. A tunnel is being run from the surface of the hillside lower down, to tap and drain the shaft.

MR. SHURTLEFF's mine is on the other side of the Conrad, and immediately adjoins it. The last crushing, a few weeks ago, paid quite well.

SIERRA.

HYDRAULIC MINES.—*Mountain Messenger*, May 29: Work in hydraulic mines is pretty generally well under way. At St. Louis and Howland flat, water is plenty and work is progressing rapidly.

GRAVEL MINES.—We understand that the 1001 gravel mine, above Sierra City, commenced washing on Wednesday. The company do not look for any very remarkable returns, as they have only the gravel taken out in running the tunnels necessary to prospect the mine. No breasting has yet been done. The Con. G. M. Co. has been sold. The claim comprises 450 acres of the most promising gravel mining ground in the county.

TUOLUMNE.

JAMESTOWN.—Cor. *Independent*, May 29: They have made a rich strike at the Barry mine, Quartz mountain, and in the Moony claim on Whisky hill.

GOLDEN ROCK.—The recent clean-up at the Golden Rock gravel mine, after a 30-days run, yielded $2,000. This run was made under many disadvantages.

OLD TUOLUMNE.—Work has been resumed on this mine, 2½ miles northeast of Columbia. There are a number of shafts and cuts along the vein, all showing splendid prospects. One shaft is down 100 ft in good ore, carrying sulphurets and free gold. It is the intention to start a tunnel from the main river, on the vein, which will give several thousand ft of backs, and make a mine that will last for an age.

NEVADA.

WASHOE DISTRICT.

SCHEEL MINE.—*Territorial Enterprise*, June 1: This mine is situated to the southward of the Forman shaft, and is owned and worked by Herman Scheel. He is his own Supt. and Board of Directors. The vein in which he is working is about 100 ft wide, and contains 3 pay streaks—one 2 ft, one 8 ft and another 14 ft in width. The large ore streak contains the most silver, but the smallest is the richest, carrying more gold than the others. The mine is worked through tunnels, and a 2d level has just been opened, which shows improvement over the 1st. In the bottom of this last level a winze will soon be sunk, when it is expected that still richer ore will be encountered than any above. The ore now being extracted runs from $30 to $120 per ton. Mr. Scheel says his mine is open for all who wish to take a look at it.

QUINN.—*Chronicle*, June 1: It is reported that a rich strike was made yesterday in the crosscut on the 200 level of the Quinn. The specimens exhibited are black sulphurets, stephanite and ruby silver. The edge of the ledge was cut into last Saturday, and the crosscut was driven some 8 ft in low-grade ore, when the rich ore mentioned above made its appearance. The specimens of ruby silver are the handsomest ever found on the Comstock. The black sulphuret ore is said to assay as high as $800, and the other specimens are of course nearly pure silver. Nothing is yet known about the width of the ore body on the 200 level, but should it prove of no greater width than it was on the level above, it is estimated that the ore known to exist from that point to the surface is worth not less than $700,000.

HALE & NORCROSS.—Letter of May 28th says: Sunk incline 28 ft and placed 3 sets of timbers. Finished cleaning up 2100 level and started a small drift south, which shows bunches of ore. Will have an average assay made for my next weekly report; 3 men are working at this point. Have secured 2200 south drift and reduced the temperature to about 120° Fahr.

CON. IMPERIAL.—Letter of May 30th says: Started Alpha-Imperial joint drift east from station on 2800 level; have advanced same 10 ft; face in porphyry. Are still engaged in digging water drain in main lateral drift, 2800 level.

GOULD & CURRY.—Letter of May 30th says: The joint shaft has been sunk and timbered 35 ft since last report; total depth, 1,190 ft.

AURORA DISTRICT.

THANKSGIVING MINE.—Dispatch to Bodie *Free Press*, May 27: The Thanksgiving mine has been sold to-day to New York capitalists. Work has been commenced on the property to-night. Ore will be extracted and milled as early as possible. The company also purchased a mill site, on which a 20-stamp mill will be erected.

HOISTING WORKS.—During the present summer hoisting works will be erected on Middle and Last Chance hills, and in a short time we expect to vie with Bodie.

CHERRY CREEK DISTRICT.

BOHEMIAN GIRL.—Cor. White Pine *News*, May 25: The Bohemian Girl mine is situated in what is known as the upper belt, in this district, between the Teacup and Pine Nut mines, and is owned by Messrs. Barrick & Griswold, who have done a considerable amount of work upon the property with their own labor, sufficient to demonstrate the fact that they have a perfect formation, a strong vein, carrying mineral, with some rich ore in sight, and with a reasonable expenditure of money in the development of the property, its owners would be likely to reap a handsome reward.

ITEMS.—The Star mill started up May 24th, after having been shut down a couple of days for repairs. The Schellbourn mill is still running, although it is evident that the company would find it more profitable to dry crush their ore.

ESMERALDA DISTRICT.

ESMERALDA MINE.—*Herald*, May 29: Work will be commenced on this mine in a few days. Ore will be taken from the mine and piled on the dump to await the building of the mill that is now sure to come. It is the intention of the managers of the Esmeralda to put on only a small force at present, but when the mill is put to work, a large force of men will be put on, and the ore will be extracted as rapidly as possible.

EUREKA DISTRICT.

BANNER MINE.—*Sentinel*, May 27: Work on the Banner mine will be resumed to-day, by the McGarry Bros. and Mr. Kelly, of the company. They propose to prosecute developments vigorously during the season. The Banner is one of the best known and defined mines on the mountain, and has a first-class record, having yielded perhaps a larger amount of ore than any mine in its vicinity. The main shaft has reached a depth of 350 ft, showing a perfect fissure vein all the way down. There is no better prospect than the Banner in this district.

I X L DISTRICT.

NEW DISCOVERY.—*Silver State*, May 26: J. W. Richards, of Churchill county, just up from I X L, informs us that a new discovery was made in the mines a few days ago, which seems to be richer than anything hitherto found in the district. He predicts a bright future for I X L.

PARADISE DISTRICT.

GLORY MINE.—*Reporter*, May 29: The first batch of ore from this magnificent prospect was worked at the Sedan mill on Friday, and gave a battery assay of $172.79. Although this result is very satisfactory to both owners and lessees, much better figures would have been got if more attention had been given to sorting.

PARAGON.—This mine is being rapidly developed, and is employing a force of 50 men. The line shaft of the mill broke down again during the week, but the mill ran on tailings and no time was lost.

BULLION.—The mine is being thoroughly overhauled, and is employing a force of 20 men. The mill is running on 3d-class ore, and has crushed daily, for the past 14 days, 20 tons, which has been worked to 80% of the battery assays.

MOUNT ROSE.—The drift is still in good ore, and the mine is looking well. Negotiations are pending between the Mount Rose and Bullion companies for working the ore from this mine at the Bullion mill.

PROSPECT MOUNTAIN DISTRICT.

NAME OF DISTRICT CHANGED.—Eureka *Sentinel*, May 23: The great fire of 1879 having destroyed the records of Spring Valley district, the miners of that district recently changed its name to Prospect Mountain district, by which it will be known hereafter. During the summer a number of the mines of the district will be worked, as many of the old locators are now upon their mines engaged in taking out ore.

WILLOW CREEK DISTRICT.

PROSPECTS.—E. P. Torrey returned from a visit to the Willow Creek mines. He says there are several fine prospects in the district, but none of them have been developed to any great extent, except the Ohio, which he considers the best mine ever opened in the county.

ARIZONA.

TOUGH NUT.—Cor. Yuma *Sentinel*, May 20: Discoveries on the 113 level in the Tough Nut show a solid body of ore 20 ft wide.

GOOD ENOUGH.—In the Good Enough on the 100 level, from a single cross drift, they are taking out 15 tons of very rich ore a day. The prospects all show this mine to be truly wonderful. Since the 20th of May the bullion produced is 100 bars, valued at $206,000.

RICH DISCOVERY.—In the San Jose mountains, 25 miles from Charleston, gold croppings assaying $18,000 per ton have been discovered. These croppings are near the claim of J. H. Slaughter, who has a vein of gold quartz 4½ ft wide at a depth of 35 ft, which assays way up in the thousands.

HOLLAND MINE.—The Holland mine, Patagonia mountains, at a depth of 80 ft assays $177 in silver and 57% lead. They have 25,000 tons of ore on the dump. This mine is owned by the Holland M. & S. Co., of N. Y., who have a 30-ton smelting works ready to put up, and will be in operation in 40 days.

BRADSHAW MINE.—Tenney and Newton, of S. F., have bonded the Bradshaw, located two miles from Charlestou, for $40,000. They have 2 ft of ore at a depth of 60 ft, averaging $400 per ton.

WARSAW MINE.—The Warsaw, owned by the Grion Co., of Philadelphia, is one of the best developed mines in the district. There is great deal of work being done in the district.

MCCAFFERTY MINE.—This is considered one of the great mines in Arizona. It has a shaft down 200 ft, showing very rich ore.

DOS AMIGOS.—This mine has a shaft 75 ft deep, and yields ore assaying from $40 to $1,400 per ton.

CAVINESS MINE.—In Mineral Hill district rich strikes are reported. A shaft 100 ft deep in the Caviness shows fine bodies of ore, and a tunnel 207 ft along the ledge shows ore all the way. It assays as high as $30,000 per ton in silver and some gold.

BLACK BILL.—This mine is down 95 ft, with a 17-ft ledge, the ore from which assays up in the hundreds.

WEST RICHMOND.—This mine, in a shaft on the vein at the depth of 20 ft, struck a rich body of ore, copper silver glance, that mills upwards of $7,000 per ton.

RICH ORE.—The Silver Gulch, Victoria and Blue Cap are developing fine bodies of rich ore, which, with the fine location for mining, makes the basin a very promising locality.

PRINCESS MINE.—The main shaft in the Princess is down 90 ft and looks splendid. This shaft follows the hanging wall down, and is in a continuous vein of ore all the way.

RED CLOUD.—Work on the Red Cloud has been suspended for a few days, but will commence again immediately.

COLORADO.

WHITE QUAIL MINE.—Leadville *Herald*, May 23: A very important strike has been made in the White Quail mine, at Ten Mile district. There are 1,500 tons of ore mined at this claim at the present time, and the regular production is now from 20 to 30 tons daily. This has been fair-grade ore, but last week, in the incline running from the north level from the tunnel, some very rich ore was struck.

ROBINSON MINE.—This mine is piling up immense amounts of valuable ore, awaiting the completion of the smelter and the drying up of the road to Lesdville. Work is being driven on the new smelter, which will be of 50 tons daily capacity. The roasters are kept busy in concentrating ores, but can handle but a small portion of the amount produced.

SNOW BANK.—The strike on the Snow Bank, made about 2 weeks ago, has proved a very important development for the camp, and has greatly encouraged mine owners in the vicinity. Two hundred tons of ore, rich in both lead and silver, have already been mined.

BUENA MINE.—*News and Courier*, May 28: A Philadelphia company is working the Buena mine, at Jamestown, day and night, giving employment to 10 men, engaged in sinking shafts and drifting to disclose the ore. One shaft is sunk to the depth of 85 ft; another 55 ft. This is a tellurium vein of the 1st water, judging from the mill returns, the last run of 1st-class ore yielding at the rate of $5,280 per ton.

GOLDEN AGE.—This well-known mine is now employing a small force in sinking shafts and opening up the mine. At the bottom of the main shaft, 300 ft deep, there is disclosed a vein of free gold milling ore over 4 ft wide. From this a crosscut has been run 35 ft to the footwall, there cutting a streak of smelting ore.

CARIBOU MINE.—This mine, through its Nederland mill, sends for shipment an average of $5,500 per week in silver bars.

BONANZA GROUP.—This location covers 4 veins of free gold ore. One shaft is down 53 ft, and the ore is claimed to carry from $50 to $100 per ton, all the way down. This property is reported as about passing into the hands of a N. Y. company.

NI-WOT MINE.—This mine is producing 300 ounces of gold per month, from the regular running of 25 stamps. The ore way worked is 10 ft wide.

SNOWDEN MINE.—This a tellurium vein of large size. The company is about to raise ore again, which will add much to the rising monthly gold product of this county.

PETZITE MINE.—Dolores *News*, May 22: The tunnel on the Petzite is now in streaks of rich ore, assaying as high as $1,000 per ton, gold and silver.

ROMERICK DIU.—The vein has been exposed for a width of 10 or 12 ft and no walls as yet, so that the width of the mineral body is still a matter of conjecture.

LEGAL TENDER.—The Legal Tender lode, of Horse creek, is one of the largest gold-bearing quartz leads in the country, having an 181-ft vein.

VALLEY VIEW.—This location, on Telescope mountain, has a 15-ft shaft in 13 inches of ore. The owners are now sinking an incline on the ledge.

IDAHO.

BONANZA CITY.—Challis Cor. *World*, May 25: There was some excitement at Bonanza City when I left—three days ago—over the good clean-ups made from dirt from Mr. Morrison's placer claims, about a mile above town. The gold is very coarse, and last Tuesday 7 ounces of gold, in nuggets, were taken out of dirt from one set of timbers. Wednesday 10 ounces were cleaned up and one nugget weighed a little over 4½ ounces. The claims are very rich, and will be an incentive to the N. Y. Co. to push operations ahead on its extensive ground a few miles below Bonanza.

POVERTY FLAT.—Men just in from Poverty flat report the mines looking splendid. A furnace capable of reducing 25 tons of ore per day is being erected in that section, and there is a move on foot for the erection of another as large. The parties who will put up the latter have no mines, but will purchase ores to work. Most of the machinery for the former is on the ground and the rest coming from Blackfoot.

CHALLIS will be the shipping point and general headquarters for Bonanza, Yellow Jacket, Bay Horse, East Fork, and, in fact, the whole mining country in eastern Idaho.

IDAHO AND VISHNU.—*Statesman*, May 27: In April the Idaho and Vishnu mine struck the ledge with their tunnel and have a fine vein, averaging from 18 inches to 2 ft in width of $100 ore. The ore chimney is over 300 ft in length, and it is estimated that $40,000 are in sight. The 4 lessees have about 50 tons of ore out and are now taking out about 3 tons daily. Even by present working these mines will yield a large amount of bullion this season.

ADA ELMORE.—The sold Ada Elmore mine will be thoroughly reopened and worked extensively this season by Mason & Smith, bankers of N. Y. city. A company called the Ada Elmore G. & S. M. Co. has been formed and the necessary capital raised. To reopen and work this mine properly and successfully will require an outlay of from $30,000 to $50,000.

ALTURAS AND WIOR WEST.—Mr. Johnson and his lessees have out from 40 to 50 tons of ore from the Alturas mine. The Wior West mine have out considerable ore and are daily extracting more.

MONTANA.

ANSELMO MINE.—Butte *Miner*, May 25: Lately this mine has furnished some of the richest specimens of ore produced in this district. The shaft is 85 ft deep, and the vein is continuous from the surface, changing about half way down from a free to a base ore and gradually enlarging to the bottom, where it is not less than 4 ft wide, and yields by assay from $200 to $400 per ton.

CLEAR GRIT.—The work on this claim is confined mainly to driving westward at water level. A crosscut 50 ft west of the working shaft has just been completed, and 16 ft of very hard quartz was found between the walls at this point. It is richest near the footwall. Considering the fact that several hundred tons of medium high-grade ore has been produced with slight development, and that 16 ft of ore width is found in the only crosscut made, the chances for a bonanza are very flattering.

SALISBURY MINE.—An important strike is recorded in this mine. The vertical shaft is 75 ft deep, and from the bottom a level has been run east for a distance of 130 ft. Last week a 15-inch streak was struck in the face of the drift which assayed 1,500 ounces. Within the past few days, however, this streak has widened, and is now fully 7 ft wide. Several hundred tons of ore have been extracted, which is now being worked at the Silver Bow mill.

WAKE UP JIM.—This mine continues to improve with development. The east level is in about 40 ft, and considerable free ore is being stoped, assaying from 40 to 60 ounces. The Wake Up Jim is one of the widest ledges in the camp.

GRAY ROCK.—Recently at a distance of 17 ft from the main level a 3-ft ledge of excellent looking ore was uncovered, assaying 69 ounces in silver in the top and 71 ounces in the bottom, the water level seeming to run midway from the ceiling to the floor, dividing the free milling from the base.

STEVENS.—The drift running northeast from the bottom of the 40-ft shaft has been extended to a length of 60 ft, following a 2-ft vein of 50-ounce ore, of which about 00 tons are on the dump. Other shafts on the claim are being prospected with excellent results, a considerable amount of 100-ounce ore being taken out.

NEW MEXICO.

GEORGETOWN DISTRICT.—Cor. *Grant County Herald*, May 17: Our mines are all looking well, and are turning out ore in considerable quantities. McGregor Bros. are about completing a whim to be run by horse power, on a new shaft which will be sunk about 100 ft. Their mine, the McGregor, is yielding the usual quantity of good ore. On the Commercial mine Messrs. Kelley & Irwin have a lease and are taking out a large amount of very high grade ore. Bragaw and Perry are still taking out good ore, and a good deal of it, from the McNulty. Have just learned that the Mimbres M. Co. have purchased in Cal. a 10-stamp mill (800-lb stamps) with 8 amalgamating pans and everything complete, with engines for mill and hoisting works. So you see that we will soon not be lacking in milling capacity to work our ores as heretofore. Their mine, the Naiad Queen, is yielding ore in large quantity, and of high grade.

SAN SIMON MINES.—Cor. *Grant County Herald*, May 22: We are now convinced that San Simon will yet be second to no district in New Mexico. The work is being pushed forward with night and day shifts on a large number of claims, which are showing up better and better as the work goes on. The Sterling Price is down about 50 ft, has a 3-ft vein and is looking splendid, runs about 100 ounces silver, owned by Mr. Henry of the New York *Herald*. The Fractional is also looking away up, as are also the Carbonate and Bismarck. The latter had a mill run of over 200 ounces silver. The Little Emma has a 20-ft shaft and is being worked night and day; the showing is more than satisfactory; will sink 75 ft. In fact all the property being worked gives a good showing. The Sterling Prince is on the same vein as the well-known Fry Duncan and Rip Van Winkle mines, and needs no better guarantee of its success as a mine.

OREGON.

MAMMOTH MINE.—*Bedrock Democrat*, May 13: We learn from Mr. John Toy, who came down from this mine last week, that the owners, Messrs. Ramsdale & Baisley, have made a crushing of 75 tons of average ore, which yielded $45 per ton. The proprietors of this mine have been at considerable expense in developing and erecting machinery, and naturally feel elated over the good clean-up they have made. They have erected a 5-stamp steam mill and have a 20-horse power engine, and can add another battery whenever they feel so disposed. The ledge is 16 ft wide, 5 ft of which is good milling ore.

RICH STRIKE.—We learn from Mr. Geo. Borman that himself, Jas. Colcly, Jas. Murry, Geo. Cooper and Ed. Borman have struck a splendid gold-bearing quartz ledge. Mr. B. came to this city to have the ledge recorded. This ledge is situated about 4 miles southeast of the Virtue mine, and the ore is of the same character as the Virtue mine ore. The owners have commenced sinking on the ledge.

NEW DISCOVERY.—Baker City *Democrat*, May 26: There has been a very rich strike made about two miles east of the Virtue mine this week. We have seen some of the rock taken from there, and we can say that it is the best looking quartz we have seen in Baker county. There has been plenty of specimen quartz taken out of a number of mines in the surrounding country that excels this quartz in richness, but for average ore, this equals any ledge in the county; the discoverers have commenced sinking on the ledge and are taking out rock for crushing, they have at the present depth, 3 ft in width of solid quartz. The fineness of the gold, as near as we can judge, is about $17 per ounce.

Texas Millet.

We give on thie page an engraving of Texae millet, a forage plant whicb has gained some prominence in the Southern Statee, and is put forth as worthy of attention by the Commisioner of Agriculture in hie report for 1878. It is repreeented to be a graes of vigorous, rapid growth. It is very leafy, tbe leavee broad, rather tbin, eprinkled with eoft bairs. It growe two to three feet high, but tbe epreading etalke are often four feet or more in length, growing very cloee and tbick at the base, and yielding a large amount of food.

Thie grass hae been brougbt to tbe attention of tbe department during eeveral yeare paet. Mr. Pryor Lea, of Goliad, Texae, has had it in cultivation for a number of years, and writes respecting it as follows: "I coneider it far euperior to any grase that I ever eaw for bay. It is a much more certain crop than millet, and cultivated with leee labor, and all kinde of etock prefer it. I expect to report a good eecond crop on the eame ground thie year. In thie region tbis graes, in the condition of well-cultured hay, ie regarded as more nutritious than any other grass. It growe only in cultivated land; it prospers best in the warmeet fourtb of the year; its luxurioue growth eubduee other graseee and eome weeds, witb the reeult of leaving tbe ground in an ameliorated condition."

The following is the tecbnical deecription of tbe plant: Branchee of the panicle rough, the pedicele with ecattered haire, eepecially near the flowere; spikelets oblong, eomewbat pointed, 2 to 2½ lines long, sparsely bairy; lower glume balf or two-thirde tbe length of the upper, acute, 5-nerved, the lateral nerves uniting with the midnerve below the apex; upper glume prominently 5 to 7 nerved, pointed; eterile flower with 2 palets, the lower 5 to 7 nerved, much like the upper glume, the upper palet thin and transparent, as long as the lower; perfect flower ovate or oblong-ovate, acutieb, tranevereely wrinkled with fine reticulated striæ.

An annual graee two to four feet bigh, eparingly branched, at firet erect, becoming decumbent and widely epreading, very leafy, ebeathe and leaves finely eoft—bairy; margin of the leaves rough; leaf bladee 6 to 8 incbes long and ¼ to 1 inch wide, upper leaves reaching to the base of tbe panicle, or nearly so; panicle 6 to 8 inchee long, etrict, tbe branchee alternate, erect, eimple, 3 to 4 inchee long, with somewbat ecattered eessile spikelete.

THE BODIE MINES.—For eeveral months all tbe Bodie etocks have ruled low in the Board. Thie has not been caused through their want of merit, but rather througb the witbdrawal of large amounts of capital from the State and the fears entertained by capital remaining in the State as to tbe action of tbe Legislature upon their interests. Thie eource of trouble baving paesed away, the borizon ie now clear, and capital will again come from its hiding-place and revivify the veine of trade with ite golden etream. The days of stock-jobe and boome have paesed away, and in the future we may only look for them to the extent aud value of ore bodiee uncovered and expoeed to view. We are glad euch ie the caee, ae it ie tbe only basis upon which mining can ever be made permanently eucceseful. Thie bringe it within the purview of all husineee conducted upon eound principlee, and takee from it the gambling feature—a bane to any enterprise. So far as Bodie minee are concerned, under tbie new order of the mining trade, tbe real merit of our undeveloped mines will place them in the front rank of legitimate mining enterprisee. It is true our mines remain almoet in their virgin purity, yet the favorable proepects of the propertiee of Queen Bee Hill, Silver Hill, Bodie Bluff and High Peak, in the mines sinking to great deptbs, and from geological indications known to be cloee to tbeir ledgee, whilet othere have already cut them and are now opening them up and developing their riches, it ie no experiment with ue, but an aseured fact that our mines, placed in the market at their proper value at the preeent ehowing, will advance a hundred per cent. within tbe next eix months, purely on their merit, and many of them will advance a thousand.—*News.*

THE WILLOW CREEK MINES.—Another ledge of fabuloue richneee is reported to have been found a few daye ago a ehort dietance from the etage station at Willow Creek on the Idaho road. We have heen unable, eo far, to learn any particulars relating to tbe new find, except that the ore is fabulouely rioh in eilver. The lucky diecoverere eimply eatiefied themeelvee that they had found a ledge, that it contained rich ore, and then located it, after wbich they repaired to tbe etation and celebrated the event in the old-fashioned way hy getting on a epree. The preeent prospects denote that Willow Creek will eoon be a prosperoue mining camp. The Obio mine, the first diecovered in the district, ie said to be one of the heet in the whole upper conntry. It ie eomewhat remarkable that thougb tbe creek hae yielded coneiderable free gold, and a number of Chinese have been engaged in placer mining there for the paet year or two, that no gold-bearing ledges have yet been diecovered in the vicinity. Somebody will find a lead there eome of these daye that will throw Bodie in the ehade, as the free gold which ahounds in the gravel must have come from a quartz vein eomewhere in the adjoining ranges.—*Silver State.*

The Copper Boom.

D. H. Jackeon, Supt. of the North Bonanza and Flowery mines, has purchased the copper mine in Mason valley owned by J. Daniels. The copper mine ie eituated in Mason valley, about two milee from Walker river, and bas been opened by a ehaft 100 ft. in depth. A drift ie heing run on the ore body and the shaft ie being eunk to a greater depth as fast as muecle and power can do it. Abont 120 tone of the surface rock has been reduced at the Dayton reduction worke, yielding from $21.50 to $36 per ton of copper and from $5 to $20 per ton of gold and eilver, and as deptb hae been attained in the shaft the grade of ore hae constantly increaeed in value. They are now, while driving the drift and einking the shaft, taking out from tbree to four tons of aecorted rock per day, eetting it aside for reduction. Tbe drift will be run on the ledge to tbe line of the claim, when crosscutting and etoping ore will be commenced. The sbaft will be continued and etatione opened out at each 100 level. The width of the vein ie not known, but at the eurface it ehows from 40 to 50 ft. in width. The company will immediately commence the conetruction of reduction works on the Walker river, about two miles from the mine, and when completed thie mine and worke will undoubtedly prove a veritable bonanza. It is a mountain of copper ore, and in places ehows large quantitiee of native copper. The former owner, a ranchman, mined the ore, and, hauling it to Dayton, sold it to the hluestone manufactory at that place. There is not a timber in the mine. In extracting the ore Mr. D. left great pillare of ore—10 to 15 ft. in diameter—ae eupporte. Mr. J. will emelt the copper, running it into ingots for traneportation. An abundance of charcoal can be obtained in the immediate neighborhood of the mine. There is also plenty of water in the vicinity.—*Esmeralda Herald.*

TEXAS MILLET.—Panicum Texanum.

A TON of ore from the San Jacinto minee, in San Diego county, hae been shipped to New York to test its value. If the working teet proves satiefactory, the eale will be completed, and anumber of men employed extracting ore.

GIGANTIC MINING ENTERPRISE.—An aesociation known as tbe "Eocene Tunnel and Mining Co.," bae filed ite claim to all tbat part of the North Fork of Feather river, from bank to bank, for a distance of 11 milee, deeignated on the map and commonly known ae the "Big Bend of the North Fork of Feather river." It also claime the rigbt of way for tunnele, flumee, ditchee or pipes neceeeary to eucceesfully work the same. The objects of tbe company are eet forth to be tbe diverting of the water from ite natural channel and the mining or digging of the river bed, and all bare located in it, within the confines above deecribed, for precious metale. It ie aleo etated tbat the company does not propoee or intend to interfere with veeted or accrued rights already acquired by other partiee. That the company is a powerful moneyed inetitution ie fully demonstrated by the following namee of the membere: Wm. H. Vanderbilt, Anthony J. Drexel, Chae. H. Lewie, Joe. H. Banker, Thoe. A. Edieon, R. L. Cutting, Jr. Geo. C. Perkine, Chas Batchelor, Wm. H. Cox, F. McLaugblin, E. W. McKinstry, J. C. Logan, John Hoey, G. W. Cumminge, P. O. Hundley. This ie beyond question the greateet mining enterprise ever undertaken on thie continent, and it poseesses a capital unequaled by any financial institution in tbe world except, possibly, the Rothechilde. Operatione will be entered upon before tbe cloee of the present season. The fabnlous wealtb of Feather river bed mineral deposits ie eo well known, and hae been eo etrikingly demonstrated by the few developmente hitherto enacted on a emall ecale, that the feasibility of this nndertaking and the profitable character of the inveetment are queetione admitting of no diecussion.

RICH TAILINOS.—We learn from the Reno *Gazette* that the old tailings of the Ophir, at Franktown, are now yielding $300 ner day, of which $175 is clear profit, and the amount will average that eum for the next two yeare, the time required to work up all of tbe tailings.

SEVERAL of the ownere of quartz mines in the vicinity of Fort Jones, Siekiyon county, will huild emall mille this epring, as they find hauling to cuetom mille, and paying the going rates for crusbing, to be an eneroue tax.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for tbe benefit of our readers:

DECISIONS OF THE U. S. COURTS.

Parks et al. vs. Booth.

Supreme Court of the U. S.—Decided October term, 1879. Appeal from the Circuit Court of the U. S. from the Northern District of Ohio. Mr. Justice Clifford delivered the opinion of the court:

1. It is essential to the validity of a patent that the particular invention he pointed out and distinguished from what is old, and when the inveution consists merely of a new combination of old elements or devices, when nothing is or can be claimed except the new combination, it is sufficiently described to constitute a compliance with the letter and spirit of the law if the devices of which it is composed are specifically named, their mode of operation given and the new and useful result to be accomplished is pointed out, so that those skilled in the art and the public may know the extent and nature of the claim and what the parts are which co-operate to do the work.

2. It is not necessary to allege or prove, in order to sustain the defense of prior patent or printed publication, that such patent or publication was issued or given two years earlier than the patentee's invention.

3. When the patent covers an entirety it cannot he defeated by showing that the several component parts are old in other connections. It must appear that they have existed together in the same relation.

4. More than one patent may he included in one suit, and more than one invention may he secured in the same patent, in which cases the several defenses of prior invention and public use may be made to each patent in the suit and to each invention to which the charge of infringement relates.

5. The patent act allows the infringer to plead and prove that the invention of the patentee had been in public use or on sale in this country for more than two years before the inventor applied for a pateut; but no question of priority is open under that defense, nor will evidence sustain it that another had made or patented the invention two years before the application without the knowledge of the patentee whose invention is in question.

6. It not appearing that the complainant was guilty of laches in applying for a patent, or that *his improvement* ever went into public use or was on sale in this country before he applied for a pateut, the patent was held to be valid.

7. Interests in the profits decreed to the complainant should not be allowed. The profits in such case are to he regarded in the light of unliquidated damages, which usually do not draw interest without the special order of the court.

* More complete reports of the proceedings may he found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

QUIXOTIC DREAMS OF MINING.—Among the numerous mining schemes by which money was "epent in the Florida war," in the way of mining schemee in Oroville, wae the propoeition to eink a ehaft on the bank of the Feather river, tunnel from the shaft under the river, and then work up through the bedrock and eecure the gold in the hed of the stream. The ehaft was eunk on the bank of the river, but it filled up with water eo fast that no tunnel could he run under the river. Another scheme of great expectations was that of the "eucker boate," which were to navigate the river and run their elephant-like suckere over the bottom and draw up the gold. The wrecke of theee boate line the river for eome dietance below Oroville, eome of them dismantled, with their machinery taken out or abandoned. Now comee another propoeition, and "by Jingo, the man and the money" is on hand to try it, and that ie to hore a hole down any distance to the depth of 200 feet, and eet a machine to running with buckets, eomething like an elevator for grain, to gather tbe dirt and the gold duet as it comes up, and dump it on top of the earth ready to he waehed. Thie machine, when in full hlast, will, it ie eaid, work a square of about 200 cubic feet per day, and of course promiees great results.—*Chico Record.*

A BIG TUNNEL PROJECT.—We have heard some talk thie week about a big tunnel enterpriee tbat is heing worked up and put in ehape by partiee who requeet that their names he kept out of print until their preliminary arrangemente are fully completed, when we will he at liberty to publieh all the particnlare. We can eay, bowever, without committing a hrcach of confidence, that the projected tunnel will probahly start at a point eomewhere near the eite of the old Antelope mill, and run under Silver Hill, a distance of about a mile and a half, tapping the great backbone of the ridge at a depth which has not yet been accurately determined, hut deep enough at any rate to eettle all queetione concerning the permanency of our minee. Lateral drifte will be run to intereect blind crose-veine which, with coneiderable reason, are euppoeed to exiet on eitber eide of the line of the tunnel. That which will he extended eaet into Last Chance Hill will drain the Real del Monte ground eeven or eight hundred feet below present workinge, and enable tbe company to diepenee with the uee of a boat in going about the lower levele. The tunnel will be a big thing for the town, but we hope Sutro won't he mixed up in it, for he ie death on grase widowe.—*Esmeralda Herald.*

A SURGICAL instrument for the extraction of the poieon from wounds inflicted by venomous or rabid animale is mentioned in the Englieh medical journale. Suction with the lipe hae sometimes been reeorted to in euch caeee, but ie undoubtedly dangeroue to the persou who attempts it. This has been clearly ascertained in regard to the bite of the cobra.

A STATEMENT iseued hy tbe Bureau of Statietice ebowe that the total value of the exports of petroleum and petroleum products of the United Statee dnring the month of March, 1880, was $2,378,342, and during March, 1879, $2,059,826; for the nine monthe ended March 31, 1880, $30,615,256, and for the same period in 1879, $31,448,961.

The Engineer.

Coal Dust Explosions.

At the meetiag of the Royal Society, af England, March 13th, a paper was read "Oa the Influence of Coal Dust in Colliery Explosione," by W. Gallaway; commnnicated by Robert H. Scott, F. R. S. The paper described various experiments in proof of Mr. Galloway's now well-known theory of colliery explosious, tho first being made with a very simple apparatus consisting of a coutiuuous pipe about 18 in. in diameter, wbich conducts a small portion of the return air from the point at which it is injected into the atmosphere by tho ventilating fan to a convenient spot au the level of the surface, where it eecapes as a strong current, amounting to 1,251 cubic ft. per minute. About 6 ft. from ite point of exit a lamp can be placed ia the center of the current, aad at a distance of about one ft. still ncarer the origin there is a means of allowing coal dust to fall into aad mix with the passing air. It ie found that when the coal dust ie added, the air becomes instantly inflammable, sbowing that all the return air ia the workings may be easily brought into the samo condition by a sadden disturbance, euch as that caused by a local explosion of fire-damp. Tho second experiment was intended to illustrate the effects of an explosion of fire-damp in a dry mine containing coal duet. The only means of avoiding the dangers due to the presence of coal dust in mines appears to be to carefully and conetantly water tho roadways leading to and from the working places. "It is very interesting to be able"—says *Nature*—"to mention a fact in connection with watering the roadways, which, althongh not mentioned in Mr. Galloway's paper, is well worthy of a place here, viz., that the Abercarne explosion ramified through every part of the workings, which were exceedingly dry and dusty, with the exception of one dietrict from which it was entircly cut off by 200 yards of a very wet roadway, and that the men in the latter district not only escaped unhnrt, but hardly felt the explosion. The wetness of this roadway was due to natural causes."

The East River Bridge.—The N. Y. approach to the East river brdge is finished with the exception of about four blocks, and the property through to Chatham street has been appraised by the bridge authorities. Should this not be accepted by the owners, a commisaion, acting under the railroad law, will be appointed to value the land. Upon this portion of the work 90,000 bricks are being laid daily. But one block of the Brooklyn approach remains unfinished. The cities still hold about $1,000,000 of an interest accruing from the sale of bonds. The first 100 tons of the recently awarded contract for steel have been sent from the Cambria Iron Company at Midvale to be rolled; from there they will be taken to the Edgemoor Iron Company, who do the drilling, fitting, etc. The bill for the final appropriation —$2,250,000—now pending in the Legislature, has passed the Senate with an amendment, and is in the Honse, where it is favorably received. —*Engineering News.*

A Truly Elevated Railroad.—The traveler, the tourist, can now visit the crater of Vesuvins without inconvenience, a railroad having been constructed that takes one to the very aperture of the volcano. The terminal station of the road is situated at an altitude of 810 meters, or 210 meters above the observatory. In connection with the station is a restaurant and *cafe*, with capacity to accomodate 100 persons. The angle of inclination of the road is at places 40°, 50° and even 63°. There are two coaches for the transportation of passengers—the Vesuvius and the Etna—each one of which can take 12 persone. The system adopted in the construction of this railroad is of American invention, and is called the "prismatic system."—*La Raza Latina.*

Bridge Engineering.—The designs of the Forth bridge—a much more dangerous undertaking than the Tay bridge—are to be reconsidered, and that it is very doubtful if the gigantic echeme, as at present conceived by Sir Thomae Bouch, will he carried out. It is to be regretted that more pains were not taken to elicit from a large number of engineers designs for the crossing of the Forth estuary, for not until more eubstantial etructures are proved to be impossible ehould a suspension bridge for railroad traffic be permitted. To hang up from towers cousiderably higher than St. Paul's cathedral two huge epans of 1,600 ft may he a very grand scheme, but hardly one to be risked without urgent need.

The Upper Mississippi.—Gen. Wright, Chief of Engineers, has made a further report on the improvement of the Upper Mississippi. It appears that the reservoir will hold 56,000,000,000 cubic feet of water, available after July 1st. It ie estimated that at St. Paul the volume of the river would be doubled. The total cost would be $400,000; operating expenses, $7,840 per annum.

Large Shipments of Coal.—The shipment of coal from Seattle, W. T., for the month of April, exceeded any previous month since the opening of the mines. Eleven vessels cleared with an aggregate of 16,275 tons, and with two vessels half loaded at the chutes, makes the total amount delivered on board vessels nearly 18,000 tons.

Useful Information.

Facts Useful and Curious.

Tho greyhound runs by eyesight only, and this we observe as a fact. Tho carrier pigeon flies his 250 miles homeward by eyesight—namely, from point to point of abjects which he has marked; but this is only our conjecture. Tbe fierce dragon-fly, with 12,000 lenses in his eye, darts from angle to angle witb the rapidity of a flashiag sword, aad as rapidly darts back, not turning in the air, but with a clash reverciag the action of his four wings, aad instantaneously calculating the distaace of the objects, or he would dash himself to pieces. But in what conformatioa of the eye does this coasist? No oae can answer.

A cloud of 10,000 gnats dance up aad down in the sun, the minutest iuterval between them, yet no ono knocks another headlong upoa the grase, or breaks a leg or wing, long and delicate as these are. Suddenly, amidst your admiratioa of this matchless dance, a peculiarly high shouldered, vicious gnat, with loag, pendaat nose, darts out of the rising and falling cloud, aad, settling on your cheek, ineerts a poisonous sting. What possessed the little wretch to do tbis? Did he smell your blood in the mazy dance? No one knows.

A carriage comes suddenly upon a flock of geese, on a narrow road, and drives straight through the middle of them. A goose was never yet fairly rnn over, nor a duck. They are under tho very wheel and hoofs, and yet somehow they contrive to flap and waddle safely off. Habitually stupid, heavy and indolent, they are nevertheless equal to any emergency.

Why does the lonely woodpecker, when he descends his tree and goes to drink, stop several times on his way, listen and look round, before he takee his draught? No one knows. How is it that the species of ant, which is taken in battle by other ants to be made slavee, should be the black, or negro ant? No one knows.

The power of judging of actual danger, and the free and easy boldness which reeults from it, are by no means uncommon. Many birds seem to have a most correct notion of a gun's range, and while scrupulously careful to keep beyond it, confine their care to this caution, though the most obvious resource would be to fly right away out of sight and hearing, which they do not choose to do. And they sometimes appear to make even an ostentations use of their power, fairly putting their wit and cleverness in antagonism to that of man, for the benefit of their fellows. We lately read an account, by a naturalist in Brazil, of an expedition he made to one of the islands of the Amazon to shoot spoon-bills, ibises and other of the magnificent grallatorial birds, whicb were most abundant there. His design was completely baffled, however, by a wretched little sandpiper that preceded him, continually uttering his tell-tale cry, which at once aroused all the birde within hearing. Throughont the day did this individual bird continue his self-imposed duty of sentinel to others, effectnally preventing the approach of the fowler to the game, and yet managing to keep out of the range of his gun.

Cements for the Shop.

Iron Cement for Closing the Joints of Iron Pipes.—Take of coarsely powdered iron borings, five pounds; powdered sal-ammoniac, two ounces; sulphur, one ounce; and water sufficient to moieten it. This composition hardens rapidly; but if time can be allowed it sets more firmly without the eulphur. It muet be used as soon as mixed and rammed tightly into the joint.

2. Take sal-ammoniac, two ounces; sublimed sulphur, one ounce; cast iron filings or fine turnings, one pound. Mix in a mortar and keep the powder dry. When it is to he used, mix it with twenty times its weight of clean iron turnings or filings, and grind the whole in a mortar; then wet it with water until it becomes of convenient consistence, when it is to be applied to the joint. After a time it becomes as hard and strong as any part of the metal.

Cement for Uniting Leather and Metal.—Wash the metal with hot gelatine; eteep the leather in an infusion of nutgalls (hot) and bring the two together.

Cement for Leather Belting.—One who has tried everything says that after an experience of 15 yeare he has found nothing to equal the following: Common glue and isinglass, equal parts, soaked for ten hours in just enough water to cover them. Bring gradually to a boiling heat and add pure tannin until the whole becomes ropy or appears like the white of an egg. Buff off the surfaces to be joined. apply this cement warm, and clamp firmly.

Steam-Boiler Cement.—Mix two parts of finely powdered litharge with one part of very fine sand, and one part of quicklime which has been allowed to elake spontaneously by exposure to the air. This mixture may be kept for any length of time without injuring. In using it a portion ie mixed into paste with linseed oil, or, still better, boiled lineeed oil. In this state it must be quickly applied, as it soon becomes hard.

Turner Cement.—Melt one pound of resin in a pan over the fire, and when melted, add one-quarter of a pound of pitch: While these are boiling add brick-dust until by dropping a little an a cold stone, you thiak it hard enough. In winter it may be necesaary to add a little tallow. By means of this cement a piece af wood may be fasteued to the chuck, which will hold when cool; and when the work is fiuished it may be removed by a smart stroke with the tool. Any tracee of the cemeat may be removed from the work by means of benzine.

Wollaston's White Cement for Large Objects. —Beeswax ane onace; resin, four ounces; powdered plaster-of-parie, five ounces. Melt together. To use, warm the edges of the specimen and nee the cement warm.

Gutta-Percha Cement.—This highly recommeaded cement ie made by melting together in an iron pan, two parts commoa pitch and oae part gutta-percha, stirring them well together until thoroughly incorporated, and then pouring the liquid iuto cold water. When cold it is black, solid and elastic; but it softens with heat, and at 100° Fah. is a thin fluid. It may be used as a soft paste, or in the liquid state, and answers an excellent purpose in cemeatiag metal, glass, porcelain, ivory, etc. It may be used instead of putty for glazing windows.

Luminous Flowers.—Amoag the elcgant novelties of the hour now offered for sale on the Paris boulevards are phosphorescent flowers, which glow with a lambont light in the dark, and rival their natural tints. They are rendered luminous by coating the petals with transparent size, and then dusting them with a phosphorescent subetance, such as canton phosphorus (sulphide of calcium) or Bologna phosphorus (sulphide of barium). Canton phosphorus is the best, and yields a soft yellow light. According to M. Becquerel, a good quality can he made by mixing 48 parts of flowers of snlphur with 53 parts of calcined oyster shells, and raising them to a temperature of between 800 and 900 degrees centigrade in a crucible. After exposure to sunlight during the day, or to the electric or magnesium light, the flowers thus coated becomo brightly luminous in the dark.

The Secretary of the American Iron and Steol Association reports 697 blast furnaces in the United States, with an annual capacity of 6,500,000 tone of pig iron; 382 rolling mills, with an annual capacity of 4,000,000 tons, the capacity of the rail mills being 2,150,000 tons; 11 Bessemer steel works, with an annual capacity of 1,750,000 tons, besides 11,880 miscellaneous works.

Good Health.

Constipation.

It is doubtful if consnmption numbers as many victims as are stricken down by the various diseases that result from habitual constipation. True consumption is an inherited disease. It may remain always dormant, but when aroused to action, decay commences at a point circumscribed, and gradually extends—unless arrested—until so much of the lungs become involved that vital action ceases. The evils of constipation result from inattention to the calls of nature, and usually commence with children whose habits are not closely looked to by their parents. The processes of nature are always active while life lasts. When effete matter is retained a moment beyond the time its expulsion is demanded, the system commences its efforts to get rid of it. When the natural egrese is checked, the absorbents carry the more fluid portions of the poisonous mass into the circulation, and it becomes diffused throughout the body. The more solid or clay-like portion is forced into the lower rectum where it becomes firmly impacted, thns cutting off the circulation in the small blood vessels, causing painful engorgement known as piles and hemorrhoids. A continuence of these troublee often results in fissure, fistula or cancer. The trouble is seldom confined here. As a result of the blood poisoning we almost invariably find more or less dyspepsia, with decided derangement of the functions of the heart, liver and kidneys, accompanied by headache and nervous debility, often verging on paralysis.

Persons of sedentary habits are most subject to constipation and its sequences. Before the plan of treatment devised by M. Nelaton was introduced, habitual constipation was a disease of far more serious import than at the present time. All physicians admit that cathartics afford only temporary relief, and catharsis cannot be induced except by stimulating the bowels with irritants, and as this irritative process gradually weakens their peristaltio action, the relief from them steadily diminishes until disease of some vital organ sets in, and terminates life. Relief from injections is just as pernicious, with the added danger of strictures of the rectum. With these facts in view, M. Nelaton commenced his inveetigations, which resulted in proving beyond question that all uncomplicated cases of constipation, the obstruction exiete solely in the lower portion of the rectum, and within reach of local remedies. For the radical cure of the various diseased conditions, he invented "Nelaton's Suppositories." It is said they succeeded beyond his own expectations. But in old and severe cases their use must be persisted in until the cure ie complete.—*Hall's Journal of Health.*

Cautions in Eating.

1. Of course don't eat too much. The digestive fluide are limited in quantity. All above enongh is undigested, irritating and weakening the system, and often causing paralysis of the brain by drawing on the nervous force more rapidly thau it is generated.

2. Don't oat botwecn meals. The stomach must rest, or it will sooner or later break down. Even the heart has to rest between the beats.

3. Dou't eat a full meal when exhausted The etomach is as exhausted as the rest of tbe body.

4. Dou't take lunch at noon and eat heartily at night. The whole digestive system needs to share in the reet and recuperation of eleep. Besides, the tendeacy is to put a full meal into a wcakened stomach.

5. Don't substitute etimnlns for food—like many women who do half a day'e work oa strong tea or coffcc. As woll, in the case of a horse, substitute the whip for oats.

6. Don't have a daily monotony of dishes. Variety is necessary for relish, aad relish is necessary to good digestion.

7. Don't eat blindly. There can be nothing in the body—muscles, membranes, bones, nerve, brain—whicn is not in our food. Oae article furnishes ono or more elements, and another, others. We could starve on fine flour. Some articlcs do not nourish, only warm.

8. Eat according to the season—one-third less in summer than in winter. In the latter fat meat, sugar and starch are appropriate, as boing heat-makers; in the former, milk, vegetables aud every kind of ripe fruit.

9. Eat with cheer. Cheer promotes digestion; care, fret and passion arrest it. Lively chat, racy anecdotes and innocent gossip are better than Halford sauce.

Artificial Respiration.—The *Medical Press and Circular*, 1880, informs us that in a recent communication to the French Academy, Prof. Fort raises again the question of premature interments. One fact he mentione is, that he was enabled to restore to life a child three years old, by practicing artificial respiration on it four hours, commencing three hours and a half after apparent death. Another case was communicated to him by Dr. Fournol, of Billancourt, who, in July, 1878, reanimated a nearly drowned person after four houre of artificial respiration. This person had been in the water 10 minutes, and the doctor arrived one hour after asphyxia. Prof. Fort ineists also on the utility of artificial respiration in cases of poisoning, in order to eliminate the poisons from the lungs and glands. The length of time it is desirable to practice artificial respiration in any case of apparent death from asphyxia, Prof. Fort has not yet determined, but his general conclusion is that it should be maintained perseveringly for several hours.

Starving out Cancers.—At a late meeting of the Leeds (England) Medical and Chirurgical Society, J. W. Teale read a case of quiescent scirrhus. The patient was an unmarried lady of 35. A cancer formed in her breast, causing retraction and ultimately loss of the nipple; it ulcerated; some axillary glands enlarged, and the patient seemed about to die. But in consequence, as it seemed, of the small quantity of food taken by the patient, the cancer was "starved." It atrophied slowly; and now, nine years after its first appearance, there was nothing but a hard cicatrix left in the breast and axilla. Cases more or less similar were related in the discussion which followed.—*Medical and Surgical Reporter.*

Healthy Property of Onions.—The healthy property of onions has never been fully understood. Lung and liver complaints are certainly benefited, often cured by a free consumption of them, either cooked or raw. Colds yield to them like magic. Don't be afraid of them. Taken at night, all offense will he gone by morning, and the good effects will amply compensate for the trifling annoyance. Taken regularly they promote the health of the lungs and digestive organs. An extract made by boiling down the jnice of onione to a syrup, and taken as a medicine, answere the purpose very well, but fried, roasted or boiled onions are better. Onions are a very cheap medicine, within everybody's reach, and they are not by any means ae "had to take" as the costly nostrums a neglect of their use may necessitate.

Treatment of Simple Hiccough.—Dr. Grellety once saw a mother, tender and full of affection for her children, give them a morsel of sugar dipped in table vinegar whenever immoderate or too rapid repletion of the stomach or auy other cause had inducod hiccough. The The latter ceased as if by magic. Since then the Vichy physician has very frequently employed this means on his own account, and has never fonnd it without avail.—*The Pharmacist and Chemist.*

To Remove Gunpowder Marks.—Smear the scorched places with glycerine, by means of a feather, thenapply cotton wadding; lastly cover with oil silk. In one case the discoloration was very great, the patient looking more like a mummy than a living being. It entirely subsided in a month by the above treatment.—*London Lancet.*

A Pleasant Mouth Disinfectant.—Hypermangate of potassa and hyperoxydate of barium of each 24 grains, to be ruhbed up into a mass with sugar and glycerine, and divided into 144 lozenges. Every ill-emelling mouth will become by their use perfectly odorless.—*Medical Record.*

The Week.

Since our last issue pleasant summer weather has prevailed throughout the State, and the reports from farm, garden, and vineyard, are generally cheering. The norther, which prevailed in the interior for several days, did not fortunately cause much damage to the crops; there was a shrinkage of wheat in some localities, and slight injury to gardens; but on the whole, the blustering north wind brought good rather than evil. In the higher counties the snow is melting rapidly, and active work in mining districts resumed.

Our multifarious mining exchanges teem with accounts of discoveries and booms and active, hopeful work. This feature is especially noticeable in the mining camps of this State, where something of the old-time activity prevails. It would appear that the gold quartz mines are receiving unwonted attention, and the outlook for a prosperous and productive year is excellent.

An interesting inquiry has been placed on foot in the House of Representatives in regard to the effect of the debris from the mines upon our harbor, which will result, it is hoped, in bringing out trustworthy data and practical suggestions and, what is better still, appropriations for relief.

Decoration Day, made a legal holiday by the last Legislature, was celebrated in this city in a fine spirit. In the large procession were detachments from the national army and navy, and the military display was superb. The streets were lined with sympathetic people.

THE simplest court seal yet adopted is that of the Superior Court of Ventura county, an impress of which was filed with the Secretary of State lately. It consists of a simple pair of scales and the words, *Fiat justitia.*

Improvement in the Lixiviation of Ores.

Heretofore the leaching of ores has been practiced in one or two ways. The first, known as "filtration," is a method in which, in order to allow the liquor to permeate the ore freely after roasting, very coarse crushing was necessary, which rendered high chlorinations impossible. The second is known as "agitation;" to crush the ore to the finest division, roast it and then treat it in tubs with the leaching liquor, and agitate it until the chloride of silver was dissolved. The whole mass was then allowed to settle, and the liquor on the surface was drawn off. The remaining liquor—60 or 70 gallons per ton—with which the ore is saturated, and the silver contained therein, is usually lost.

Neither of these processes has been very successfully operated in a practical way, for the following reasons: In the first-named process the coarse crushing of the ore prevented such a furnace chlorination, owing to the size of the particles, as to render impossible the chlorination of a high percentage of the silver in the ore, and the silver thus lost kept the process from being profitably worked. In process second, though the ore was crushed sufficiently fine to obtain a good chlorination, the loss of silver due to the loss of silver-containing liquor with which the ore is saturated, after the surface liquor is drawn off, prevented a profitable working.

Mr. David W. Brunton, lately of Silver Peak, Nev., and at present, we believe, at Georgetown, Col., has recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a method of lixiviation, which consists in a series of steps, carried out in conjunction with proper apparatus, whereby he leaches the precious metals from finely divided ores roasted at a low temperature, so that the base-metal chlorides formed in the roasting remain in the body of the ore. The invention further consists in a leaching process, wherein the solvent liquor is made by the solution of base-metal chlorides formed in the roasting of the ore being treated.

A supply tub to hold the base-metal chloride leaching liquor, is placed on a frame above another tub, so that the required supply of base-metal chloride solution is run from the upper to the lower tub. A revolving stirrer in the lower tub is then set in motion, and as it revolves the hot roasted ore from the furnace is fed into the leaching liquor until the required amount is immersed. The revolution of the stirrer is continued until the chloride of silver in the roasted ore is dissolved, which takes from four to six hours. Then the charge of ore and leaching liquor now charged with argentic chloride, is drawn off into a filter tub which is provided with a false perforated bottom. In this filter tub the charge is allowed to settle until the particles of ore sink to the false bottom. Then the greater portion of the argeutiferous liquor will be at the top and it is drawn off by a siphon.

In drawing the silver-containing liquor from the filter tub, after the siphon has exhausted all that is upon the surface, there still remains an amount due to the salivation of the finely divided ore, and this is removed by flushing the top of the mass of ore with pure water, and as the liquor is of greater specific gravity than the water, it is forced toward the bottom of the tub or displaced by the water.

In roasting the ores at a low temperature the inventor loses neither any of the silver nor base-metal chlorides formed during the roasting of the ore. These base-metal chlorides formed in the roasting of the ore, are soluble, and when water is added to the ore they dissolve and form a solution which is a solvent for argentic chloride. Thus the inventor utilizes the base-metal chlorides formed in roasting the ore, in making a solution which dissolves the chloride of silver.

The advantages that the process has will be apparent to metallurgists, in that it allows one to use successfully finely divided ores which can be roasted at a low temperature just sufficient for chloridization, and thus avoid the volatilization of the base-metal chlorides and consequent loss of silver; and that the base-metal chlorides formed in roasting the ore are utilized as solvents of the argentic chloride; and that a maximum percentage of the silver is secured.

SUTRO TUNNEL IMPROVEMENT.—It is reported that the Sutro tunnel company has entered into an arrangement (in Europe) by which they will receive $150,000—over and above royalty and advances by Comstock companies for the lateral tunnels—for the purpose of putting a double track in the main tunnel so as to take out the low-grade ores of the Comstock. Also that a company is about to be formed for the purpose of building mills at the mouth of the tunnel and to prospect the ledges cut by and belonging to the tunnel company. The new company will bear all the expense, and the tunnel company is to receive a share of the net profits.

VALUABLE GOLD NUGGET.—Recently Mr. John Borland picked up in his gravel claim at Forest Hill, in this State, a gold nugget of the value of $500. At the same time a number of fair-sized pieces of gold were found in the sluices. Mr. B. has been engaged three years in opening his claim.

Arizona.—No. 6.

A few miles east of Tuhac, on the west slope of the Santa Ritas, is the Tyndall mining district, which embraces the principal historic mines worked by the Jesuits and Mexicans, and the rude works of the native races. At its northeast angle is Mount Wrightson, also known as Old Baldy, the highest of the Santa Ritas. The lodes which cross this district are amazing in their length and still more so in their width. One of the principal is the Empress of India, which not only runs across the Tyndall district, but on to the Aztec, which adjoins it on the east. The Empress of India mine, 4,200 feet above the sea, is three miles north of the old Salero shaft. The lode runs east and west, and for its whole length has croppings of from 100 to 300 feet. The casing is granite, the vein porphyry, gneiss and quartz, strongly colored with iron and containing some manganese. Other lodes are the Rohley, Gibbons, Salsro, Broghill, Sedgwick, McDonald, Gedge, Ahsrcorn, Blake, Hamilton, Grossett and Buena Ventura, also, in the Santa Rita valley, the Allen and Bell. The top of the shaft of the Old Salero mine is about 5,700 feet above the sea, and the Gihhons, one mile from it, and probably on the same lode, is 4,800 feet. The ore of the Bushell, Forsythe and Old Salero mines assaye as high as $400 per ton, but does not average more than $75.

The Aztec district, east of the Tyndall, is crossed by the Empress of India lode, on which are the Montezuma, Inca and Hidalgo mines. The ore is green and black silver mixed with manganese. North of the above lode, the Apache, Iturbide, Coronado, Ahundancia and Lost lodes have been located, and several mines located upon them, while south of them is the great Aztec lode, with the Aztec, Anahuac and Toltec mines. This gigantic lode is 46 feet wide on the surface at the west end of the district, enlarges to 286 feet in the middle of the Aztec mine, is from 270 to 300 ft. at the Anahuac, and narrows again at the Toltec. Here are also the Almoner and San Bruno lodes. The Aztec syndicate, the headquarters of which is at Indianapolis, owns many of the mines of this region. The Toltec Mining Co., organized in 1878, by capitalists of Hartford, Bridgeport and Waterbury, Conn., is also actively at work. It owns about 10 mines, among them the Bushell, which is believed to be the old Tumecarori mine, the Knoxville, Webster, Velasco, etc.

South of the Aztec is the Patagonia district, in the mountains of the same name, and extending from Sonoita creek to the borders of Sonora. Here are located the Kershaw, Mowry, Trench, Silver Bill, Patagonia, Holland, La Hermosa, Hardshell, and other valuable mines. The ledges are good and wide, and crop boldly out for long distances. Much of the ore is free milling, but contains a considerable quantity of copper silver glance, and some veins carry so much galena that they have to be smelted. Here are the settlements of Hurshad, with a population of 500, Washington camp with 300, and Patagonia camp.

The Tombstone district, east of the San Pedro, is now the scene of most excitement. The richness of the region had long been suspected, but the Apache was dreaded more than the gold was desired, until, in the early part of 1878, three men, E. Schieffellon, A. Schieffellon and Rich Gird, two old soldiers and a miner, resolved to try their luck. They were told before starting that they would find a tombstone instead of a mine, so, striking it rich, and finding no Indians they named the place Tombstone. Others say the name was taken from the shape of the out-croppings upon the hills, slab-like, and resembling tombstones of gigantic size. Possibly these made the miners think that they had found both mine and tombstone in one. The news of the discovery spread fast, and soon a few others joined them.

But people said that the ore was too rich to last, and that the mines would prove to be only pockets, especially as the surface formation was limestone. Nine of the best mines were offered to S. F. capitalists for $90,000 and refused. The miners themselves shared the fear, and dared not go deep. At last a couple went down 80 ft., and came to a perfect formation, with even, smooth walls, and a well-defined vein. This was the Tough Nut mine, and soon a 10-stamp mill was put up on the San Pedro to mill its ores. Then came the Contention, owned in S. F. Two shafts were sunk to a depth of over 200 ft., and some 500 ft. of levels run, and experts not usually given to exaggeration, declared that in sight in the mine and on the dumps were $3,000,000 of value. The owners have been offered $2,000,000, but declined the offer, and have just completed a fine 20-stamp mill. The ore of this mine and of the Tough Nut assays from $200 to $300 per ton, and grows better downwards. The Lucky Cuss, owned by Eastern capitalists, was developed to a depth of over 250 ft., in Oct., 1879.

Other valuable mines are the Grand Central and its South Extension; and the San Pedro, which, at the above date, was developed to 100 ft. Others are the Prompter, Ruby, Ajax, Anchor, Sunset, Mizzentop, Three Brothers, Revenne, Boston and Nanmkeag. The Prompter is from 7 to 40 feet wide, and the ore mills $300 per ton. Several tons of ore from the Three Brothers netted over $400 per ton. The Anchor is said to be richer, and to average $1,000 per ton. The nearest water accessible is the San Pedro, and the mills are situated on this river. The Sunset mine is owned in Washington, the Empire in Boston.

Tombstone has grown rapidly. In January, 1879, it contained about 350 persons, but in October the district had some 3,000, and the town, of adobe, like most southern towns, had tolerable restaurants, and a weekly paper, the *Nugget*, was running. It is above 70 miles from Tucson, and contains over 1,500 inhabitants. Ten miles from it is Charleston, with 500 inhabitants, and with the Gird and Corbin mills.

The ore of the Grand Central taken from the upper level for three days in April, 1880, assayed as follows: First day—silver, $1,013.79; gold, $110.46. Second day—silver, $570.20; gold, $50.27. Third day—silver, $620; gold, $100.

In the first week of April of this year, the amount of bullion received from the mills of Tombstone was $52,429.83. Accounts from all sources tend to prove that these mines are, on the whole, the most extensive and rich yet discovered in Arizona. The Des Frees district is at the head of a lateral canyon some four miles north of the head of the Aravaipa canyon, in the Turnhull Mts. Silver, copper and lead are the principal metals. At Stockton's pass, 22 miles from Safford on the Gila, and 12 from Camp Grant, ore has lately been found which assays to $2,300 in silver and $722 in gold. The ledge is 2 to 3 ft. wide. The Delaware and Copper King are among the mines located. These mines are near Graham's peak, 10,500 feet high, in the Pinaleno Mts.

West of the Santa Cruz valley, and intersected by Sopori creek, is the large district of Arivaca, the richness of which, as we have seen, was known in the last century to the people of Tubac. Here is the Heintzelman mine, opened 25 years ago, and thus the oldest of the modern workings in the Territory. Deserted through the hostility of the Apache, the crumbling walls of extensive buildings remain to show that work was commenced on a grand scale. The rock in this district is chiefly porphyry, and the veins, although comparatively narrow, are well defined, with strong surface croppings often rising from 10 to 50 ft. above the surrounding rocks like great stone-walls, and bear an exceedingly high grade of ores. Here are found argentiferous galena, native and horn silver, chlorides and carbonates, black metal or patangue, and in some veins gray copper and tellurium; all of high grade. Most of the veins yield gold, and in some the gold predominates. Most of the ore is free milling, but some requires smelting, every facility for which, in the shape of fluxes, is found in the district. Here are the Fairview, Ajax, Con. Arizona, Idaho, Mentor, Dos Amigos, Cerro Colorado, Heintzelman, Los Alamos, Tajo and Van Nostrand mines; also the Belmont, Home Ticket and Combination, while in the smaller Oro Blanco district to the south are the Ostrich, Orion, Sacramento, Papago Chief and others.

Within three to five miles of the Cerro Colorado are 10 valuable properties owned in Conn. About $300,000 of Eastern capital is invested in the Arivaca mines, principally from N. Y., Phil., and Ind. The town of Arivaca, 70 miles southwest of Tucson, has a population of 600, and a public school. North of Arivaca is the Pima district, with the Pima, San Xavier, Esperanza and Tinaja mines, and a population of about 150.

Dos Cabezas, 110 miles east of Tucson, is the center of a new mining district in the northern part of Chiricahua mountains. It contains 150 inhabitants, and has a public school. Three new mines in this region have been sold for $90,000, and the purchasers were highly pleased. The ore is principally gold. The best known is the Juniper, which now has a shaft 80 ft. deep, in good free milling ore.

Northeast of Tucson, 12 miles, is the Santa Caterina district, and northeast of this again the Old Hat district. Close to Tucson are the recently discovered districts of Tuscon and Rincon which, with the Santa Caterina and Old Hat districts, are situated in the Santa Catarina and Rincon mountains, whose lofty crests sweep boldly round the Santa Cruz valley. Fifty miles north of Tucson is the San Pedro district, with 150 people. Gold, silver, copper and lead occur. Huachuca district, in the mountains of the same name, 25 miles east of Patagonia, and southwest of Tombstone, has a population of 500, and contains some flourishing mines. This district, as well as many of the previous ones, has sprung into notice since the railroad reached Yuma.

RAILROADS IN OREGON.—The greatest activity is manifested in Oregon in projecting and building railroads. We learn that the Oregon railway and navigation company has five surveying parties in the field in eastern Oregon and in Washington Territory engaged in locating several projected lines of railroad. One of the plans of the company is to construct a road from the city of Portland to the Dalles, and the work is to be undertaken immediately; and in order to hasten the work, one party of workmen will begin at the Dalles and work westward, while the other begins at Portland and works eastward. In the course of the road there will be three tunnels—two between the Dalles and the Cascades, and one between Portland and the Cascades. Each tunnel will be about 900 ft. long. It is intended to have the road completed in time to move next year's grain crop.

Hydraulics.

Written for the PRESS by A. MYERS, Hydraulic Engineer.

Size of Pipes.

The trouble before was the pipes were so small that nearly all the force of the water was required to force the water through the pipes, or the power of the water was consumed by the friction along the sides of the pipe. The same difficulty was here met in applying high heads to mechanical purposes. The pipes need were too small and no power would develop; the pipes would collapse and cause great wonderment. The pipes being full when the water wheel would start, it would discharge from the pipes faster than it could be supplied from the head, and hence a vacuum would occur in the pipe and the pressure of the atmosphere on the outside of the pipe, being equal to 15 pounds to the square inch, would cause the pipe to collapse. This was a great mystery how to overcome the trouble, and to secure the advantages desired required days and nights of thought.

The difficulty is solved: Make your pipes large enough to overcome the friction of the water along the sides of the pipe. What is the relative proportion necessary to accomplish this necessity? By long experience we have been able to determine these proportions, and all of our applications in the last ten years have been eminently successful.

There is a proportion that is essential, and any variation from it hazards the enterprise. To fully describe these would require more space and time than we can here afford. In fact conditions differ, and each case requires its special calculations—necessitating the use of a qualified hydraulic engineer.

Some few years ago it was thought an impracticable thing to apply very high heads to mechanical purposes. Forty feet was considered the limit of all water powers, as it is almost impossible to confine water in a wooden penstock higher than that hight; but since the dawn of the new era, 100, 200, 300 and even 400 feet have been used with more or less success.

The maximum pressure varies, as it is applied to the different mechanical devices to transmit power derived from water. Water engines and tangential or "hurdy gurdy" wheels have been used with considerable success from 100 to 400 feet, but the power derived from them is by no means an adequate percentage; the impact being the only power realized makes the percentage very small. Hence they can only be used where the quantity of water is very limited and from very elevated falls.

Different Motors.

The first efforts to use water as a motor from high heads was by its use on a double over-shot, one placed above another. This was very expensive and very dangerous, and was little used. The few instances after they were first built and became dangerous from decay and weakness, were never renewed. Water engines were then tried and thought for awhile to be a success, but it was soon discovered that however great care was taken all the grit or sand or fine particles of silica could not be removed from the water before applying it to the engines, hence, wherever grit came in contact with the surfaces of the engine it would abrade the parts, and by constant use the parts of the engine wore away very rapidly, thus destroying the engine in a very short time. Another trouble was experienced in the fact that water being a solid and not elastic as steam or air, there was a continual pounding of the piston and thus tending to rapid disintegration, so that the water engine was very soon abandoned. Next in order was the tangential wheel or "hurdy gurdy." Some of these wheels have been very successful, and with a limited amount of water and very high head have given very fair results. But the highest efficiency of water cannot be realized in this way, but it is possibly the only plan or at least moderately efficient with the economy of the arrangements. To exceed 33% or 40% of the power of the water by this plan would be considered an excellent achievement. Where water is ordinarily abundant and high or very high heads, it would be far more economical to divide the fall into 2, 3 or 4 heads and use a properly constructed turbine built especially for the position. Turbines have proven the most satisfactory of all appliances heretofore used. The variety is very large and the experience with each variety has been satisfactory in proportion to the intelligence of the operators in setting them up. Many very good turbines by being badly handled have proven serious failures, while others with less merit, more intelligently managed, have given satisfaction and been a success.

Horizontal Flume.

For the last seven or eight years the horizontal flume has been in demand. This is our own invention, and while we speak of its merits, we will try and be as modest as the merit of the invention and our connection with it will permit.

The success of the turbine in our hands had brought us into general notice, and many of the mining difficulties were given us to solve. Prominent among them was the difficulty of using satisfactorily long bevel gear in transmitting the power of the water wheel from a perpendicular shaft to a horizontal one. These bevel gearings were very expensive and would often break, and the mill would be detained for days and weeks at great expense as well as inconvenience. To obviate this trouble and transmit the power, I suggested the horizontal wheel.

The first one put up in this manner was a 52-in. wheel under 38-ft. fall and aggregating 444 horse power, in the Eureka mill, on the Carson river, near Empire City, Nevada. It was a grand success, and from the day it first started to this has never delayed the mill on account of the wheel being out of order. The power was transmitted by a pulley on the horizontal shaft of the wheel, of 10 ft. in diameter and 3 ft. wide. The belt had to be made for the occasion. This manner of using turbines is equally advantageous for very high heads, as it dispenses with the bevel gears, and power from a high-speeded shaft can be more successfully transmitted by belt from a properly constructed pulley. To secure the greatest efficiency under any head, every circumstance connected with the experiment must have its due consideration. The wheel must not be too large or too small for the quantity of water under a given head. The pulleys and shafting must not be either too large or too small. One or the other will materially affect the working of the wheel. The pipes also, that conduct the water to the wheel from the reservoir above, have to be of proper size and capacity, and the wheel has to be constructed for the position; then success is as certain as can be reasonably expected from any good boiler and engine, well made and properly set up.

The horizontal wheel, when the draft tube is perfect, gives the highest possible power from the water used, because the spouting velocity of the water through the wheel is *perfectly* uniform at every point. With the draft tube attached as in my case, no air can get into the draft, and a perfect vacuum must exist; hence, each infinitesimal column of water will find its appropriate column of water in the draft tube, and thus, where the greatest impingement is, there will be the greatest spouting velocity. The greatest impingement is at the tips of all the buckets, the lower buckets having the same spouting velocity as the upper ones, because the water passing the lower ones have the exact pressure as the upper ones. The column from the buckets to the top, added to the column from the buckets to the bottom of the draft tube, are equal, thus making perfectly uniform velocity. No upright wheels have so uniform a velocity, because the velocity will be different as the difference of the pressure is between the bottom and top of the wheel. Since this case has been so successful, numerous imitations and infringements have been thrust upon the trade. Persons who have no manner of conception of the first principles of hydraulics, will throw their crude conceptions on the public, guaranteeing their superiority, etc.

The horizontal wheel is now thoroughly established, and most miners will see that their specifications contain provisions for Myers' horizontal flume, and then see that they are not deceived by some cheap and indifferent infringement.

THE Ponca Indians have commenced suit in the United States Courts of Nebraska and Dakota to quiet title to their reservation.

REPORTS from the Sacramento river say the run of salmon is very light, and the probabilities are that the best of fishing for the season is over.

Olive Oil-Making Machinery.

We give on this page two engravings copied from a foreign work on the olive, one showing an improved style of mill for crushing the fruit, the other a press for extracting the oil from the pulp. Fig. 1 is the improved Italian grinding mill, having two circular stones centering on a common shaft, one each side of a vertical shaft, which turns on its pivot below, and is stayed to the cross beam above. The horse is attached to the clevis on the right, and as he treads the circle the two stones revolve upon their common axis, and one follows the other around the circular basin in the stone bed, which is shown in section in the engraving. Of course the crushing is done by the weight of the stones as they revolve upon it. The primitive style of oil mill had but one stone, and the improvement consists in placing a stone each side of the vertical post.

Fig. 2 shows one form of press used for forcing the oil from the pasts which comes from the mill. This pasts is put into bags made of the tough Esparto grass, which are put one upon another sometimes, with an iron plate between them, and thus a number of bags are pressed at once beneath the same screw. The appearance of the bags when pressing begins and when it is finished is shown by the engraving. The empty press upon the left shows the construction of the bottom plainly. The press is made of strong timber with iron screws and nuts. These figures will give our readers who are not familiar with the subject some little idea of the chief machinery employed in obtaining the oil from the fruit. At some other time we may find space for mentioning some of the different methods of oil making which prevail in Europe. We have also been promised a description of Mr. Elwood Cooper's machinery and methods, used by him at his establishment in Santa Barbara.

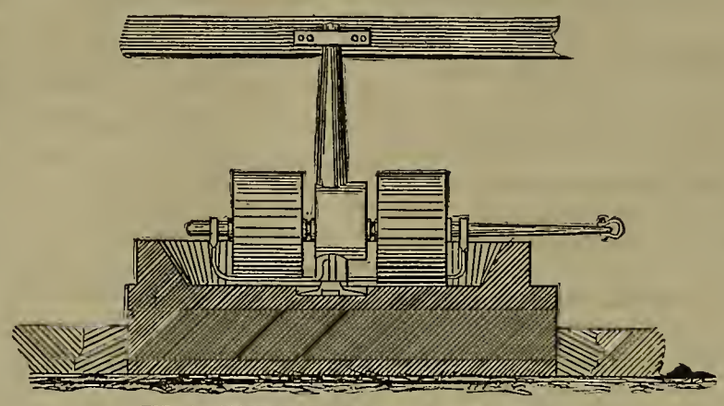

FIG. 1. IMPROVED ITALIAN OLIVE OIL MILL.

AN IMPORTANT INQUIRY.—Our representative, Horace Davis, lately introduced a resolution directing the Sec'y of the Treasury to report to the House "what causes, if any, are tending to diminish the tidal area of the bay of S. F., and what action, if any, has been taken by the Government of the U. S., of the State of Cal., or by corporations or individuals, which will tend to lessen the tidal ecour on the bar of S. F., and thereby decrease the depth of water on said bar, and diminish the value of S. F. as a commercial harbor." This inquiry will open the whole question of the effect of debris from the mines upon the harbor of S. F., and at the same time will clear the way for the scientific and, of course, intelligent discussion of local problems which have hitherto been discussed without proper data. This inquiry will place the matter fully before Congress; and it is fair to hope that the proof of serious danger to this magnificent harbor will lead to immediate action.

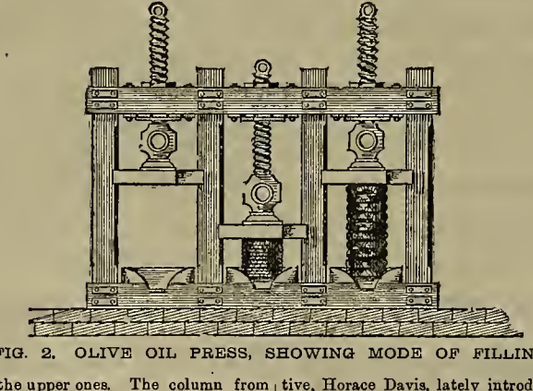

FIG. 2. OLIVE OIL PRESS, SHOWING MODE OF FILLING.

THE international rifle match between Ireland and America will take place at Dublin, June 27th and 28th.

DR. ALFRED SWAINE TAYLOR, the well-known English toxicologist and writer on medical jurisprudence, is dead.

Placer County Mines.

The Newcastle hydraulic mine, a description of which was given in the PRESS a few weeks since, made its first clean up on the 29th ult. after an experimental run of 10 days. The result was a bar of gold worth about $2,100. This establishes beyond all question the value of the mine, and it will probably yield from $7,000 to $10,000 monthly as soon as the sluices are lengthened and other contemplated improvements made.

The Alabama company have had 10 tons of their rock taken at a depth of 160 feet on their ledge at Penryn, milled at the Julian mill. It yielded $8 per ton in free gold and 2% of concentrated sulphurets assaying $150 per ton. The ledge which at the surface was 3 ft. thick has widened to 5 ft. at the bottom of the shaft which is now down 173 ft.

Several rich strikes have been made in the ledges on Duncan Hill, one mile and one half southwest of Auburn during the last few weeks. A system of parallel east and west ledges cross the hill about 200 ft. apart.

The Shurtleff vein on which Mr. A. Shurtleff owns 2,000 ft. has been prospected the most thoroughly. Its average width is 2 ft. and the pitch 65° to the south. The ledge has been prospected by a tunnel 530 ft. long, open cuts in the croppings and two shafts each about 80 ft. deep. The vein quartz is rotten and decomposed down to the greatest depth the mine has yet been opened, 250 ft. The ore shows free gold and has milled on the average $25 per ton. That at present being taken out at a depth of 80 ft. mills $100 per ton.

To the south of the Shurtleff and distant 200 ft. is the Conrad mine, bonded to Messrs. Roberts & Co. who are working it. The vein pitches 55° south, and is 2 to 2½ ft. thick. It has not been prospected much yet, the shaft being down only 75 ft. The rock shows free gold and is much harder and less decomposed than in the Shurtleff vein. The first 20 tons crushed yielded $106.50 per ton.

Thorp & Co. own the next location on the south on which they have sunk a shaft 215 ft. They are now running a tunnel to drain the shaft. The ledge is similar in character and prospects to the Shurtleff and Conrad.

At the iron mine near Clipper Gap, a large force of men are employed laying the foundations for the furnace, building house, etc. It is expected that the iron will be running by September.

MINING OUTLOOK IN UTAH.—The accounts of mining prospects in Utah Ter. are of a highly encouraging character. The daily receipts of bullion and ores in Salt Lake city prompts the *Tribune*, May 29th, to say that the mining outlook in Utah is not surpassed by that of any other State or Territory. It directs attention to the fact that comparatively a small number of men are engaged in mining; that only a few assessments are levied; and that, as a rule, mining work has been superficial, in justification of its boast. It says there are not half a dozen mines in the Territory which have attained any depth, and that generally mining operations have been carried on by poor men unaided by capital. This has been possible because the miner finds a ready sale for his ore in Salt Lake city, and the facilities for getting them to market have been fairly good. The few mines which have been sold abroad worked injury rather than good to the Territory. The most notable in the lot is the Emma mine, which now promises to show that it is not a swindle, however much swindling may have been achieved in connection with it. Within the present year the Emma is likely to prove that it is a good, honest and productive mine. While there is no excitement in Utah, the mining interest is progressing in a quiet, business-like way, which is entirely satisfactory to all concerned.

HOT WATER OF THE COMSTOCK.—It is doubtful if any mining operation in the world, at any time, presented any difficulty at all comparable to that which is encountered in the mines of the Comstock from the influx of hot water. It is the worst enemy which has yet appeared to tax the ingenuity of the managers, and to exhaust the patience and the substance of the shareholders. The *Enterprise* says it not only steams and burns, at times making work almost impossible, but it puts out the fuses in spite of every precaution. The ordinary fuse yields at once to the penetrating power of the hot water; even a solider fuse, specially prepared for the work, cannot withstand the hottest water. Against such a powerful element the utmost efforts of the miner avail but little, and there is small cause for wonder that progress is slow and the attendant cost great. The wonder should be rather that work can be done at all under such a supreme difficulty.

NEW YORK MINING EXCHANGE.—The American Mining Stock Exchange was formally opened at New York, June 1st. It is located at No. 63 Broadway. The opening address was made by Mr. Geo. W. Smiley, in the course of which he gave a detailed history of mining operations in the principal mining fields of the country. Speeches were made by Gov. Milton S. Latham and others, after which it was announced that the exchange was ready for business.

The Lost Placers.

There is something very singular about the lay of the land and the mineral condition of things in this vicinity, judging from the standpoint which would naturally be taken by a placer miner who had experience in surface work in the early days of California, when a good prospect in the top soil in almost every instance led the miner unerringly to a rich quartz vein, and perhaps to a big pocket. At the head of nearly every gulch that was more than ordinarily rich in surface gold, valuable ledges of quartz have since been found; and hills that contained gold-bearing rock in any quantity had paying placers along their bases. Of course there were some exceptions, but the rule that "quartz is the mother of gold, and that gold always goes down hill," was so generally applicable that an apparent exception to it excited comment and sometimes considerable wonder. Gold is often found, however, in places so remote from localities from which it might have come, that the miner is sorely puzzled and tempted to knock in the head all his preconceived theories. The California aphorism, "Gold is where you find it," was suggested by instances of this kind. On the summit of Bear mountain—a lofty peak about 10 miles from Sonora, on the Stanislaus river—smoothly washed gold has been found from time to time, and the question of how it came there has long been a puzzling one, there being no higher land adjacent. The explanation adopted is that the mountain was thrown up at a period subsequent to the formation of the river placers at its foot, but this theory is not supported by the geological formation of the mountain itself, which is apparently much older than anything in its immediate vicinity and existed long before the Stanislaus had cut its way toward the sea through the grand canyon just below. But we digress, as the cheap lawyers say. We started out with the intention of saying something about the placers we ought to have about Aurora, and inadvertently drifted into the sublimities of geology. Last Chance hill was wonderfully, fabulously, rich on the surface. It is not exaggerating to say that the bullion known to have been shipped from here through the expresses and banks, of which a record was kept, represented not more than three-quarters of the total amount extracted; for the facilities for stealing were unexceptionable here in the flush times, and many a fat pocket was worked out, of which parties not interested never heard. It was said that "a hand-mortar was going in every cabin at night," and it was a fair supposition that many of them were being run on the rich specimens that had been secured during the day, honestly or otherwise.

On Middle hill were found boulders of float rock that frequently yielded $1 a pound and upward in free gold; and Silver hill, especially in the vicinity of the Antelope, yielded many very rich deposits near the surface. On Last Chance much of the gold was found absolutely free, in quartz so decomposed and friable from oxidization that it could be crushed by the hand and the gold left clean in the hand by a few puffs of the breath. The huge croppings in many instances contained rich bunches of decomposed quartz several ft. above the surrounding surface ground. In view of these facts, is it not a fair and plausible supposition that there ought to be some valuable surface mines somewhere in the immediate vicinity of the places where so much rich quartz was found? If the hills have been eroded and their surfaces disintegrated by the action of the elements, the particles which once composed rich ledge croppings, must have gravitated to a lower level, and still exists in some gulch which has been concealed by slides or wash-outs or some natural convulsion which has left no trace. Willow and Cottonwood gulches have never been prospected that we can learn. We are told that a shaft was once sunk in the former to the depth of 16 ft., when the work was abandoned because of a lack of gruh and a flux of water, hut no bedrock was reached. The fact that no placer or gulch diggings have been found is the most singular circumstance connected with the history of this camp. It is just as certain that there are rich diggings somewhere around the foot of the Last Chance hill as it is that an atom of gold was ever found there, for it is utterly impossible for that hill to have been so rich ou the surface without throwing out gold enough to make good placers. If any man or company ever bottoms Willow gulch, they will reap a richer harvest than was gathered here in the palmy days. For it is a fact which does not admit of argument, though some scrub of an "expert" might sneer at it, if there is no gold in the gulches around Last Chance there never was a color found on the hill, and all the stories about the former wealth of Real del Monte and adjacent mines are fabrications.

INTERESTING MINERALS.—Lately the editor of the Tombstone *Nugget* has been shown minerals of several varieties not usual or abundaut in any camp. Among these was a specimen of molydate of lead, haviug the true acicular crystals of molydenum. Also specimens of telluride ore, of the graphic variety, but not choice or rare specimens. Again, another specimen which is pronounced bismuthinite, containing paying quantities of both silver and gold. In counection with several samples presented we have seen fluor spar, the genuine blue-John of the Cornish miner.

Scientific and Practical Books on Mining, Metallurgy, Etc.
Published or issued. wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.
BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.
Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsoniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1307.
This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50
ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.
This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.
It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus.
It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.
Price, $3.00 coin, postage free.

Certificate of Co-partnership
OF
GEO. SPAULDING & CO.
We, the undersigned, do herchy certify that we compose a partnership transacting Printing Business in the City and County of San Francisco, State of California, under the name and style of George Spaulding & Co. That the names in full of all the members of such co-partnership and their respective places of residence are as follows, viz.: George Spaulding, San Francisco; J. Munroe Miller, San Francisco; Dwight Germain, San Francisco.
In witness whereof we have hereunto set our hands and seals, this first day of May, A. D. 1880.
GEORGE SPAULDING,
J. MUNROE MILLER,
DWIGHT GERMAIN.
State of California. } ss.
City and Co. of San Francisco. }
On this twenty-seventh day of May, A. D. 1880, before me, Sam'l S. Murfey, a Notary Public, in and for the said City and County, residing therein, duly commissioned and sworn, personally appeared George Spaulding, J. Munroe Miller and Dwight Germain, known to me to be the persons described in and who executed and whose names are subscribed to the within and annexed instrument, and they each acknowledged to me that they executed the same.
In witness whereof, I have hereunto set my hand and affixed my official seal, the day and year in this certificate first above written. SAM'L S. MURFEY, Notary Public.
"Endorsed"—Filed, May 27, 1880.
WILLIAM A. STUART, Clerk.
By J. WHALEN, Deputy Clerk.

PACIFIC POWER CO.
Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

CHAS. E. KELLY,
Attorney-at-Law,
Notary Public and Commissioner of Deeds
209 Sansome St., Bet. California and Pine, S. F.
Connection in every town in the State for collection of debts.

REMOVAL.
The offices of the following Companies will remove to Room No. 79, Nevada Block, No. 309 Montgomery street, Monday, May 24, 1880:
Chollar Mining Co.,
Potosi Mining Co.,
Consolidated Imperial Mining Co.,
Challenge Consolidated Mining Co.
Silver Hill Mining Co.,
St. Louis Mining Co.,
W. E. DEAN, Secretary.

NOW READY!
OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!
History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.
By ROBERT GRIMSHAW, Ph. D., M. E.,
Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.
This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Muley, jig, drag, circular, cylinder and hand Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of al U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed
Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid.
ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia
March 10 1880.

HOOVER TELEPHONES,
CHEAP, DURABLE, RELIABLE.
GUARANTEED TO WORK ONE MILE.
☞Prices to suit the times. Send for circulars. Room 24, No. 328 Montgomery street, San Francisco.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and eather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET,
Near First and Market Streets.

Ores worked by any process.
Ores sampled.
ASSAYING in all its branches.
Analysis of Ores, Minerals, Waters, etc.
WORKING TESTS MADE.
Plans furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines; plans and reports furnished.

C. A. LUCKHARDT,
Mining Engineers and Metallurgists

JOHN TAYLOR & CO.,

Importers of and Dealers in
ASSAYERS' MATERIALS,
Mine and Mill Supplies,
CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.
118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our stock of Clay Crucibles, Mullles, Dry Cups, etc., manufactured by the Patent Plumbago Crucible Co., of London, England, for which we have been made *Sole Agents for the Pacific Coast.* Circulars with prices will be sent upon application.
Also, to our large and well adapted stock of
Assayers' Materials & Chemical Apparatus,
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.
JOHN TAYLOR & CO.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.
(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

THE CALIFORNIA POWDER WORKS,

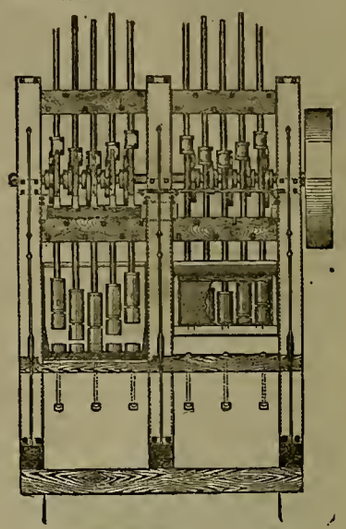
Machinery.

GOLD AND SILVER
Grinding and Amalgamating
MACHINERY.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.
Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of
$2,550.
We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.
The California Architect and Building Review.
Office, No. 240 Montgomery Street, San Francisco, Cal.
It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review" we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

HORSE HITCHING DEVICE.—Reuben Seidere, 737 Howard St., S. F. This invention relates to an improved device for securing horses at points where it is neceeeary to leave them; and it consists in the employment of a rod, one end of which may be dropped upon the ground at will. The other end is hinged to a elide which moves in a hollow harrel or guide, eaid guide being eecured beneath the vehicle in a horizontal position. A rod is secured to the elide and extends toward the front, having a loop or ring to which a line may he attached and led to the horse'e hit. When a etop ie made the binged rod may he let down eo that ite end reete upon the ground, and any forward movement of the horee will draw the eliding rod hack into the tuhe or guide, thus pulling upon the rein or line, and the horee's mouth. A epring in the rear of the tuhe forces the rod forward when the horse hacks or the strain is relieved. Thie device has heen applied to a numher of vehicles, and the inventor informs us that the reeults are very eatiefactory.

PLOWSHARE FASTENER.—Jacoh P. Patery, Dunnigan, Yolo Co., Cal. Patented May 25, 1880. No. 227,991. The mold-board and land-eide are fastened to the ehare hy levere provided with cams or catches. The mold-hoard ie secured to the curved heam and the land-eide hy meane of braces, the lower edge of eaid mold-hoard reeting on a flange on the upper edge of the laud-side. On the end of the hrace is a fulcrum of a compound lever, the emaller arm of eaid lever heing pivoted on a ewinging arm. On the end of this smaller arm is found a hook which grasps a etud on the under eide of the share. A slot is found in the end of the hrace and another in the end of the land-side, into which fit the studs found on the share, thus eteadying the ehare.

ANIMAL TRAP.—W. J. Webher, Hollister, San Beuito Co., Cal. Patented May 25, 1880. No. 227,935. This trap ie intended for the capture of animals, hirds, etc., and it consiets in the employment of one or more needlee or eharpened spears, moving in guides and provided with an elastic epring by which the needle is forced forward when released hy the action of a trigger. This trigger is operated hy the attempt of the animal to pass ite free end, and this end is concealed hy a etalk, weed, or any natural object. In combination with these devices a guard or protector is employed to be used while the trap is heing eet or carried about.

OVERALLS.—Samuel R. Krouse, S. F. Patented May 25, 1880. No. 227,981. This invention relates to certain improvements in the manufacture of overalls and that clase of garments intended for outside wear; and it consists in an improved conetruction and application of etrengthening-etrips, ataye, and re-enforce piecee hy which the hody of the fahric, pocket cornera and seams áre etrengthened, the parts are united to form a more complete mutual hand or support, while from their form a considerable economy of material is effected in the cutting of theee parts.

WALLACE'S tannery and shoe factory, at Rochester, N. H., were hurned May 27th. Loss, $50,000; partially ineured. Four hundred hands were thrown out of employment.

MISS MARY ANDERSON gave 238 performances during her dramatic eeason, which hegan Sept. 8, 1879, at Utica, and ended May 8, 1880, at Portland. The total receipte were $242,619.

The Economic Value of Truth.

We had supposed that the jonrnaliem of thie coast had well outgrown the diepoeition toward indiscriminate glorification of the country which wae the feature of our traneient literatnre a few yeare ago. We had enpposed that the folly of trumpeting everything favorable and whispering everything unfavorable had heen clearly seen and ahandoned. We believed that the conclusion had heen reached hy journalistic writers that population gained hy exaggeration of good thinge, and euppression of all reference to disadvantages in the country, wae altogether uneatisfactory. We had eupposed another tack had heen taken in the jourualietic couree, and that we had all agreed together that it ie hetter hy far to huild up the country more elowly hy telling people the exact trnth ahont our indue-tries and resources, and trusting to their own good eenee to he satisfied with California, as it really is, rather than to he continually peering ahout for the California which imaginative writers deecribed, and which no one ever eaw.

We have received a letter from a Los Angelee correspondent which indicatee that there is eomething of the "never tell" doctrine prevailing in that county, and he givee clear illustrations of the effect euch a policy exerte upon the very intereete which the journals really wish to promote. The State has unqueetionably heen eeriouely damaged hy ite friende in this regard, and there ehould he a general dieposition to remedy the old evils and guard againet more of them hy a courae of dieintereeted truth-telling concerning all mattere pertaining to our industries and the conditions under whicb they are pursued. The truth ahout California ie good enough to eatisfy any reasonahle man, and the truth will hring to our vacant areas men who will he forewarned of dangere and will overcome them hy wiee action and forethought here, ae they did in their old homee at the East. If there he any California newepaper which hae not already adopted a policy of this nature, we bope it will not long delay to act upon it. Of course there ie principle involved in such a couree, hut one need not delve to the principle to diecover the fact that the policy of half truthe ie altogether unprofitable.

There may he cases in which the course of a journal ie shaped by the apparent demande of personal proprietary interests. Wherever thie is the caee it is the misfortune of the community and of the State. A man who writes from his pocket rather than from hie head or his conscience ie poor acquieition to a neighhorhood. He does great evil, for although the immediate neighhore may recognize hie motive power and make allowance for it, there is a wider circle heyond in which his jornalietic policy doee great harm. The eame principle appliee when journale lead themeelvee to the pereonal or hueiness advancement of individuals in other waye than in inducing the immigration of the unwary. The producing intereete of the State are often much injured hy forecasts of produce or of prices made hy thoee whoee interests lead them, unconsciously oftentimes, to promulgate certain statemente without due qualification according to contingencies involved.

All this clase of intentional or unintentional misrepresentation ie false to the true office of journalism. Truth ie the editor'e most trenchant weapon. The public interest alone ehould be his master. Personal epites and grievancee can degrade the proudest jornal into a petty, peevieh, personal organ. Personal intereets never fail to transform a eheet which should he the exponent of the people'e progress, into a worthless medium for advertising pereonal lande or wares. How any editor of decent heart, and fair respect for the reeponsihilitiee of hie poeition, can conceut to make his experience and talents eerve eo low a standard of journalistic ethics ie beyond our power of comprehension.

Let us have journals for the public good: this alone can he the true test of value. And let it clearly appear, hoth to the people who own the journals and to thoee who read them, that there is no laudahle interest either puhlic or private; that there is no success which can he real and lasting, which can he eerved or secured, except hy the enshrinement of truth in journalistic halle and hearts.

DEATH OF A NOTED JOURNALIST.—Panl Morrill, the last survivor of the well-known firm which puhliehed the famoue Sacramento *Union*, died in this city May 27th. At the time of his death Mr. M. was U. S. Surveyor of this port. He was a practical printer, and hefore Cal. hecame an Amcrican State he was one of the pnhlishere of the N. Y. *True Sun*. In 1851 Mr. M. hecame a memher of the *Union* firm, and that relation will he long remembered; for that journal was alwaye an ahle, faithful and hrave champion of the people, and exerted a powerful influence for the right throughout the State and the coast. To eay that Mr. M. was one of the puhlishere of the *Union* is his worthieet epitaph.

As will be seen hy advertisement in another column, Mr. W. E. Hale hae in connection with his other hueinees, eetahliehed an Arizona and California Mining Agency. The firm of Hale & Pacheco ie well known in thie city, having heen in husinese for a long time. Mr. Hale will take charge of any mattera connected with California and Arizona mining affairs, and attend to them eatisfactorily.

UNCAS M. CO.—Capital, $1,000,000. Directors—T. J. Brower, S. H. Mather, J. M. Walker, C. E. Gillette and J. H. Colman.

The Compound Oxygen Treatment.

The number of people who are "neither sick nor well, as the saying is, make up a large proportion of nearly every community. If you ask what ails them, you get no clear answer; for they do not know themselves. They are uot sick enough to be classed with invalids, and yet they are not well enough to enjoy life nor to do any physical or mental work without a wearisome and exhausting effort. For, most of the time they feel miserable and forlorn; every task is a hurden; they have no zest in life, and little hope in the future. These unhappy people get little or no relief from physicians, but are made rather worse hy the tonics which are too often prescribed, and which leave the vital forces at a lower range after the temporary stimulation has subsided. The seashore and the mountains afford but a passing relief. Now, an agent that can restore this vital activity must, in the very nature of things, gives back health to the suffering invalid. It must act as a new and stronger mainspring would act on the machinery of the watch. That such an agent has been discovered, is no longer a matter of doubt. It is to he found in what is known as COMPOUND OXYGEN, which acts directly on the great nervous centers, rendering them more efficient, vigorous and active, and capahle of generating more and more of the vital forces, which are life and health. The cures which have followed the treatment of diseases by this new agent during the past ten years, seem often more like miracles than cases of natural healing and restoration. We have estahlished a Depository of our COMPOUND OXYGEN HOME TREATMENT at San Francisco, Cal. This will enable patients on the Pacific coast to obtain it without the heavy express charges which accrue on packages sent from the Eastern States. All orders directed to H. E. Mathews, 606 Montgomery St., S. F., Cal., will be filled on the same terms on which we fill orders sent directly to our office in Philadelphia.—DRS. STARKEY & PALEN.

In the Whole History of Medicine

No preparation has ever performed such marvelous cures, or maintained so wide a reputation, as AYRES' CHERRY PECTORAL, which is recognized as the world's remedy for all diseases of the throat and lungs. Its long continued series of wonderful cures in all climates has made it universally known as a safe and reliable agent to employ. Against ordinary colds, which are the forerunners of more serious disorders, it acts speedily and surely, always relieving suffering, and often saving life. The protection it affords, hy its timely use in the throat and chest disorders of children, makes it an invaluable remedy to be kept always on hand in every house. No persou can afford to be without it, and those who have once used it never will. From their knowledge of its Composition and effects, physicians use the CHERRY PECTORAL extensively in their practice, and Clergymen recommend it. It is absolutely certain in its remedial effects, and will always cure where cures are possible.

FOR SALE BY ALL DEALERS.

A SEMI-TROPIC FARM NEAR SAN JOSE.—The farm of Mr. Chas. Fieldsted is situated on the sunny slope of the Coast range, about five miles east of San Jose. He has quite a number of orange trees of different sizes growing, most of which are looking well. Some, already in hearing, have produced well of fair fruit. He has also lomons, limes, figs, English walnuts and many kinds of ornamental trees growing on his grounds. His carp pond is supplied hy springs of excellent water. The springs are constant and well situated for irrigating. Located in the warm helt, accessible to a large population, Mr. Fieldsted's is a rare farm. Such places are seldom offered for sale, and we can recommend purchasers to examine his offer made in our advertising columns. He will sell either 40 or 80 acres as desired.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Complied from the latest official surveys and the most authentic sources hy Edwin Bolitho. Sent, post-paid, on receipt of $1. Address, Dewey & Co., 202 Sansome St., S. F.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruher's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

Chew JAGRSON'S BEST Sweet Navy Tobacco.

Mining and Other Companies.

Persons interested in incorporated ehares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

The Annual Meeting of the Stockholders

OF THE

SPRING VALLEY WATER WORKS,

For the election of Trustees for the ensuing year and for the transaction of such other business as may be brought before the meeting, will be held at the office of the Company on

WEDNESDAY, JUNE 16, 1880, at 12 M.

By order of the Board of Trustees.

WM. NORRIS,
Secretary.

Atlanta Mining Company.—Location of principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 29th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, May 21st, 1880, and day of sale to Wednesday, June 23d, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, June 24, 1880, and day of sale to Monday, July the 19th, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

Gover Mining and Milling Company.— Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Fifth day of May, 1880, an assessment (No. 49) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-first day of June, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the Fourteenth day of July, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale

W. O. WILSON, Secretary.

Office—402 Front street, room 8, San Francisco, California.

Palmer Ice and Refrigerating Company.— Location of principal place of business, San Francisco, California. Location of Works, San Francisco, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 2), levied upon the Twenty-First day of April, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Certificate.	No Shares	Amt.
C C Palmer	7	200	$1,000 00
Wm E Wood	8	50	250 00
August Hemme	5	100	500 00

And in accordance with law, and an order of the Board of Directors, made on the Twenty-First day of April, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, 303 Montgomery street, San Francisco, California, on Thursday, the Seventeenth day of June, 1880, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

C. C. PALMER, Secretary.

Office—No. 303 Montgomery street, San Francisco, California.

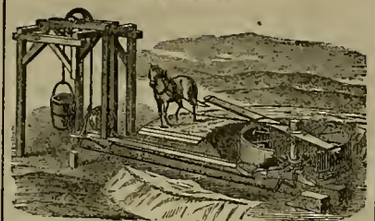
INGERSOLL ECLIPSE ROCK DRILLS.

The Best and Cheapest DRILL in the Market.

The Most Economical Air Compressors in the Market.



MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,
49 Fremont St., S. F.

Improved Grounds For Sale

NEAR SAN JOSE.

The subscriber offers for sale a tract of land, 40 acres in extent, located half a mile south of the road from San Jose to Alum Rock, and four miles from San Jose—directly in the warm belt of the foothills. The grounds are pleasantly and conveniently located, and under a high state of cultivation.

Five Acres in Orchard,

— CONSISTING OF —

Orange, Lemon and Lime Trees, Nuts,

FIGS, ETC.,

Together with a great variety of other Fruits, large and small, and GRAPES. TWO ACRES are set off for an

ORNAMENTAL GARDEN,

Which is now filled with Shrubs, Flowers and a fine growth of ORNAMENTAL TREES. 170 in number, now 11 years old. In connection with these grounds there is now a

Small Cottage and Farm House,

Well built and hard finished. On the higher ground there is a

FISH POND,

40 by 80 ft in extent, and 8 ft deep, well stocked with Carp. The pond is supplied with water from a never-failing spring a few ft distant, which delivers 24,000 gallons of water every 24 hours the year round. The pond is at an elevation of 20 ft above the house, and from it pipes are laid for irrigating the orchard and garden, and supplying the house.

Forty-three acres additional will be sold if desired, making a total of 83 acres.

This place affords a rare opportunity for anyone desirous of securing a well improved locality for an elegant country residence, and will be sold at a great bargain. For further information apply either at this office or of the proprietor on the premises.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates Orders solicited and promptly attended to.

SUB-IRRIGATION.

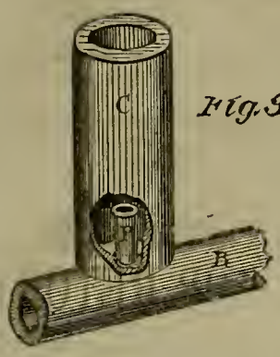

Fig. 3.

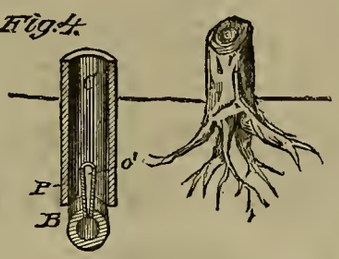

Fig. 4.

—FOR—

Orchards, Vineyards, Small Fruits, Alfalfa, Lawns, Vegetables, Etc.

The Ashestine System consists in conducting the water in concrete pipes laid below reach of the plow.

It saves from three-fourths to nine-tenths the water used in surface irrigation.

It is under perfect control, and can be applied wherever irrigation is needed.

The surface remaining dry there is no need of Summer Cultivation, either before or after irrigating.

The soil is never excessively wet *and cannot bake*, but remains moist, loose and at a nearly uniform temperature, promoting a long-continued Summer's growth.

Anything which the soil lacks as plant food (manure, lime, etc.,) can he easily, directly and economically applied in liquid form; the pest of the vineyard—phylloxera—can thus he easily reached.

No grading is necessary, as the system works perfectly on hillsides and undulating land.

Roots *cannot* get into the pipe, neither can it *suck mud*—difficulties never overcome by any other system of snh-irrigation.

The pipe is made continnously with a recently patented machine which *makes and lays* it in the trench, following all the nndulations and curves.

Water is not kept in the pipes; but is applied about twice a montb.

Three men will easily lay 1,200 feet of two-inch pipe in 10 hours.

This system and machines used are fully protected by U. S. Patents.

Our pipe machine makes the cheapest and best tile drain known, and is especially valuable for making and laying pipe for conducting water from springs, out of canyons, etc.

For fnrther information, circulars, etc., address WILSON & BROWER, General Agents for California, Sacramento, Cal., or

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

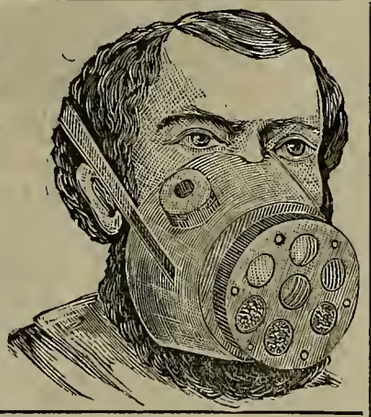
DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PATENT

LIFE-SAVING RESPIRATOR.

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

TO QUARTZ MINERS.

"The Most Perfect Machine yet Introduced into Mining."

Indorsement—Pool Mine, Hornitos, Mariposa county, Cal., May 10, 1880.

ALMARIN B. PAUL, Esq—DEAR SIR:—After a trial of your AMERICANIZED ARASTRA we are prepared to say that it runs with less than five-horse power and its capacity all that is claimed for it, viz: Ten tons per day, receiving ore from No. 20 Screen. It runs splendid, and the more we see of it, the better we like it. It gathers much more float gold than we expected it would, and we cheer fully recommend it to the attention of quartz miners as a most thorough pulverizing, amalgamating and concentrating machine. Yours truly, P. W. JOHNSON & Co.

This Arastra can be seen and circulars had, by applying to ALMARIN B. PAUL,

SAN FRANCISCO, SATURDAY, JUNE 12, 1880.

VOLUME XL Number 24.

From Evil, Good.

We are not prone to rejoice over other people's ills or in wishing one class of citizens ill that others may profit by their misfortunes. When, however, we are brought face to face with any great evil we endeavor to obtain a view of the bright side, for we believe there is no evil so dark that it has not its relative brightness in a greater or less degree. The winter of 1878-9 was one of the driest ever known in southern California. So little rain fell in the south San Joaquin valley, and the inland region south of it, that the ground at no time became wet enough to start the grain crops or the wild feed. And as it was preceded by a season scarcely more favorable, the past year proved one of great trial to all of those farmers who had not facilities for irrigation. A large majority of them did not raise enough to keep their families and their animals through the year, and work being uncommonly scarce they found it difficult to obtain employment to earn money to live; particularly was this the case in the greater portions of Fresno, Tulare and Kern counties.

About that time a few prospectors had discovered gold-bearing quartz veins in the mountains (Sierra Nevadas), and a number of farmers who had previously worked in the mines, took with them pack horses and pick and shovel and proceeded to the mountains to rehearse the times of the early mining excitements. Having nothing to require their presence at home they felt as if on a forced pleasure excursion, perhaps for profit, perchance to kill time only. As a result the mountains which had scarcely known the stroke of the miner's pick, soon became scarred from base to summit with prospect holes. Many veins of gold quartz were discovered in the foothills, while higher up in the mountains, veins of argentiferous galena that assay well in silver and contain some gold were found. In fact most of California's silver ledges yet discovered are in the higher Sierras of the southern counties.

Every party of men returning from the mountains brought rock to be assayed, which yielded with varied results. Some of the ledges proved to be of no value, but a much larger portion than was anticipated by experienced miners assayed well, and several proved to be first-class ore. Those who had not met with success in their quest for gold returned to their homes in the fall as they had left them. The more fortunate ones who had made "finds" immediately began to develop them. Mining districts were organized, roads and trails constructed to them, and arastras and other appliances built to work the ore on a limited scale. In two or three districts which had been partially developed before, large mills were erected and roads constructed at great expense, giving employment to hundreds of farmers from the valley with their teams for a good part of the summer and fall. The first shipments of gold and silver bullion have already been made from some of these mines, and preparations are under way to open up and work them in a more thorough manner this season.

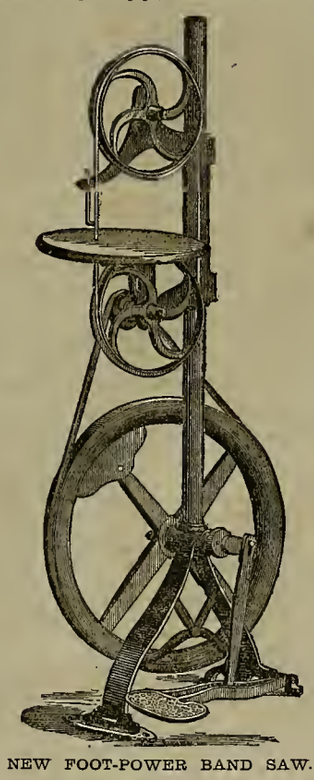
Thus a large extent of mining country that had lain unnoticed for years, and would, perhaps, have remained so for years to come, has been well prospected by farmers—formerly miners—who, in a more prosperous season, could not have been induced to leave their homes. While we sympathize with those who were caused to suffer by drouth last year, it is gratifying to know that some good resulted from it; then an extensive addition was made to our mining area that will contribute its quota to California's annual product of treasure.

COINAGE FOR MAY.—During the month of May the Mint in San Francisco coined 49,000 double-eagles, 62,000 eagles, 98,000 half-eagles, and 800,000 standard dollars—in all, 1,000,000 pieces, of the value of $2,890,000. At Carson, Nev., the amount coined was: Half-eagles, 9,500, value, $47,545; 87,000 standard silver dollars—in all, 96,509 pieces, of the value of $134,545.

A Foot-Power Band Saw.

We saw at Dunham & Carrigan's this week a light running foot-power band sawing machine, the first of this class of machines, we believe, which has been brought to this coast. It is specially adapted for country cabinet-makers, general repairing, etc. It is a practical machine with saw wheels of one ft. two inches in diameter; a small pulley 4½ inches, and fly-wheel two ft. in diameter. It is adapted to cut 4½ inches in thickness of any kind of wood, and weighs 220 pounds boxed.

As will be seen by the accompanying engraving, the table is placed breast high in a convenient position. The feet are screwed to the floor, and from them extends upward a standard formed of 1½-inch pipe, which forms the frame



NEW FOOT-POWER BAND SAW.

for the machine. Out of this standard slides a telescopic pipe adapted to extend upward to the ceiling, to which it is bolted or screwed in order to brace and steady the machine. An assortment of band saws from 1-16 to 1-4 inch come with it. The treadle may be removed, and a pulley substituted for power if desired. As a foot-power band saw, however, this machine will be found very useful and convenient.

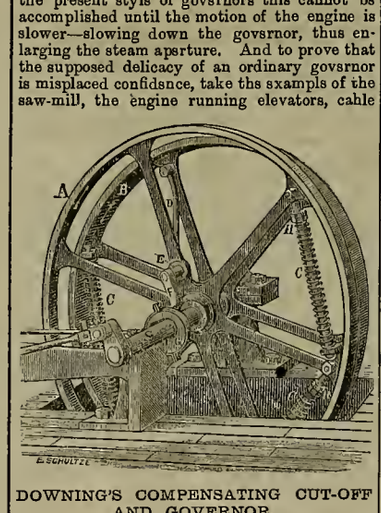
FETID ROCK.—The Park City *Record*, Utah, says that samples of rock from a ledge in Elkhorn, which were brought to its office, emit a most disagreeable odor when struck with any hard substance; and suggests "The Skunk" as a suitable name for the claim. The rock is probably stinkstone, a limestone which gives a fetid odor when struck with a hammer or pick. A variety of quartz, when subjected to friction or a blow, also gives out a fetid odor.

SMELTING AT DARWIN.—A correspondent of the *Inyo Independent*, June 5th, says that ore from the Custer, Vulcan and Promontorio, amounting to 350 tons, was smelted at the Defiance furnace in a 15-day run, yielding 100 tons of bullion of the value of $30,000. The New Coso furnace worked 300 tons of ore from the company's mine, which yielded 63 tons of bullion, valued at $15,000.

Downing's Compensating Cut-off and Regulating Governor.

With the ordinary so-called governors, so long as the work the engine has to do is a constant quantity, and the steam pressure on the piston remains uniform, just so long will the engine keep up a uniform motion; but when either of these factors varies, the speed of the engine will vary. To give an extreme illustration of this (as an extreme case can be better understood), witness the action of a saw-mill engine, or a propeller engine. The engine, in either of these cases, is subject to such sudden changes of duty that none of the present governors or automatic cut-off mechanisms have been applied with a completely satisfactory result. As an engineer on one of our coasting steamers said, in answer to a query regarding the efficiency of a governing appliance on his engine, "It works well enough in ordinary weather, but when the sea is rough we have to disconnect it and stand by the throttle all the time."

The reason the present regulators are insufficient is obvious if we but examine them for their principle. They depend upon the centrifugal force they acquire for action, and get their generating motion *from the motion of the engine.* Now, if more work is suddenly required of an engine, a greater volume of steam must just as suddenly be admitted to the cylinder. With the present style of governors this cannot be accomplished until the motion of the engine is slower—slowing down the governor, thus enlarging the steam aperture. And to prove that the supposed delicacy of an ordinary governor is misplaced confidence, take the example of the saw-mill, the engine running elevators, cable



DOWNING'S COMPENSATING CUT-OFF AND GOVERNOR.

roads, propeller engines, and any number of other instances which the interested can find.

In the case of the saw-mill, the engine may be running at 70 revolutions per minute; suddenly the log engages the saw, and more steam is required. Will the governor let the engine have it? Well, it will when the engine has slowed down to say 45 revolutions or less, so as to run the governor slower. In other words, when the duty of the engine and the volume of steam to do it have struck a compromise at half the piston speed.

In the case of the propeller engine, running at 90 revolutions, the motion of a rough sea, with considerable celerity, carries the stern of a steamer high in the air, and with it the propeller to the surface of the water, when an immediate racing of the engines ensues, to the imminent danger of the engines and ship's timbers. Does the present regulator shut off the steam supply? Not until a compromise is found at double the speed.

Mr. C. V. B. Downing, of 320 Sansome St., in this city, has, to overcome these objections, devised a regulating mechanism, actuated by the change of duty required of the engine, and governed by the laws of compensation, and this he has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency. The details of the mechanism are shown in the accompanying engraving.

A represents the fly-wheel keyed to the crank-shaft, *S*, as usual. *B* represents the driving pulley (band wheel), or gear wheel, as the case may be, which is, in this improvement, loose upon the shaft, *S*, and driven by the springs, *CCC;* these springs are free to traverse the rods, one end of which is fixed to an arm of the fly-wheel, carrying jam nuts at *HH*—used to give the springs the proper tension. One arm of the fly-wheel carries the short wrist-shaft, *E*, to which are keyed the lever, *D*, and the eccentric-arm, *F*. *G* is the eccentric, having a slot to allow a full movement across the shaft, *S*, without touching it, and so positioned as to give the same lead to the valve at any throw of the eccentric. The action of the mechanism is as follows:

The motion of the engine is "over"—in the direction of the arrow at *A* on the fly-wheel. Supposing the engine to be driving machinery by a belt on the pulley, *B*, the resistance will be in the direction of the arrow on the pulley-rim at *B;* the lugs on the arm of the pulley will drive the springs back, compressing them (since the other ends of the springs are rigid) in proportion to the load or resistance to be overcome. As this movement takes place, changing the relative positions of the fly-wheel and pulley, the outer end of the radial lever, *D*, is carried backward, throwing the inner end and eccentric forward, the eccentric then has a great throw, as the duty of the engine increases, carrying the valve of the engine with it.

By this it will be seen the resistance opposing the engine's motion is actually and accurately weighed in the same manner that any commodity is weighed in a "spring balance." And whereas, the best of the present cut-offs will not complete their action in an opening or closing movement short of three or four whole revolutions of the engine, this one will go from one extreme to the other in one-sixteenth of one revolution. And since not more than one-quarter of this movement will ordinarily be required, it is plain that its action is practically instantaneous.

By applying a pointer, the fulcrum pivot on one wheel, and the outer end carried by the other wheel, the point of which traverses an index segment at the hub of the wheel near the shaft, we have an accurate indicator, which may be consulted at any moment to find the horse power exerted, and show the engineer when an excess of friction from dry boxes, or otherwise, is using up more fuel than is necessary.

A model showing the valve movement can be seen in the engine room at Halleck block, 320 Sansome St., and a complete working model is in process of construction at the Golden State & Miners' Iron Works.

RAILROAD LEASES.—It has been supposed that a railroad company had the legal right to lease or sell its line at will; but the Supreme Court of the United States has decided that, in the absence of express authority in its charter, a railroad company has no right to transfer its road and franchises to other parties, and thus render itself unable to perform the duties which its charter, either directly or by implication, imposed. The court held that a railroad company's franchise is intended to be exercised for the public good; that the due performance of this function is the consideration for the grant; and that a contract which undertakes, without the consent of the State, to transfer to others the rights and powers conferred by the charter and relieve the grantees of the burden which it imposes, is a violation of the contract, and is void as being against public policy. The *Economist* says, considering that there are between 400 and 500 railroads in the United States, representing nearly one-fourth of the entire railroad mileage of the country, at present being operated under a lease, it will be seen that this decision of the Supreme Court is an important one, and one which promises to unsettle a large majority of the railroad leases in the country, since very few railroads, when chartered, contemplated the probability of their being leased, and consequently made no provision for such a contingency in their charter.

THE dental authorities estimate that the 12,000 dentists in this country are every year packing into the teeth of the people not less than half a ton of pure gold, costing half a million dollars.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Iron Ore in San Luis Obispo County.

EDITORS PRESS:—Having read with considerable interest that iron ore has lately been attracting a great deal of attention, not only among prospectors, but likewise capitalists, who, beginning to see the vast importance of this valuable and useful metal, have freely advanced money to further an enterprise that may in a short time eclipse in wealth the gold and silver interest of the Pacific coast, I see in your last issue that the pioneer iron blast furnace is in course of construction at Glipper Gap. This shows that the entering wedge in this direction has been started, and may he the forerunner of a like enterprise nearer home. In the county of San Luis Obispo, up to the present date, chrome iron has been the most sought after; but within the last three months the vast amount of iron ore scattered throughout the county has awakened the residents to a realization of the material wealth that would be added to this county if a step would be taken in the right direction to utilize this new resource.

Within three miles of the city of San Luis Obispo is a body of ore that would supply an inexhaustible quantity of hematite ore. The ledge is in plain sight for miles. The croppings alone, of which seven tons were sent to San Francisco to the Benchley Works for reduction, showed a percentage of 82% iron. The location is in every respect admirable for the purposes of reduction—timber for fuel in abundance and a never-failing stream of water—the distance to tide water being seven miles. Two asphaltum mines, which would produce an endless supply of material, are within 6 to 15 miles of the ledge. By this it will be seen that if in proper hands with capital to develop this enterprise, that it would be a source of profit to the parties interested, as well as a benefit to the State.

Rules respecting the reception of goods, and for determining the awards of premiums, gold, silver and bronze medals, special premiums for California.

Board of Managers.

P. B. Cornwall, Pres.; A. W. Starbird, Vice-Pres.; J. A. Bauer, Treas.; J. H. Culver, Sec'y; J. H. Gilmore, Supt.; and A. L. Fish, C. Waterhouse, James Drury, Nathaniel Hunter, F. A. Frank, David Kerr, Samuel Dinsmore, J. R. Wilcox, George H. Hopps, Edwin Fretwell and George Spaulding.

Standing Committees

For the exhibition are: Auditing—Waterhouse, Frank, Kerr; Building—Drury, Wilcox, Starbird; Circulare and Classifications—Fretwell, Bauer, Hunter; Printing and Advertising—Spaulding, Hunter, Hopps; Power and Machinery—Dinsmore, Fish, Wilcox; Rules, Regulations and Awards—Frank, Fretwell, Bauer; Tickets and Admission—Starbird, Kerr, Fretwell; Music and Decorations—Bauer, Starbird, Hopps; Privileges—Kerr, Starbird, Frank; Location—Dinsmore, Hunter, Fish; Police—Hunter, Spaulding, Hopps; Horticulture—Fish, Waterhouse, Spaulding; Gas and Water—Wilcox, Drury, Dinsmore; Art—Hopps, Waterhouse, Drury.

Reception of Goods—Rules.

The pavilion will be open for the reception of goods from and after Monday, July 26th, and the exhibition will open Tuesday, Aug. 10th, and continue, Sundays excepted, from 10 A. M. to 10 P. M., until Sept. 11th. Articles may be entered for either exhibition or competition; if the latter, they must be in position not later than Aug. 13th. Application for space must be made at least two weeks before the opening. The managers will exercise the utmost care in protecting goods, but all articles deposited will be at the owner's risk. The Board will select three jurors for each class of articles. All premiume will be for the first degree of merit only. No second-class awards or decisions will be made or reported in any cases unless otherwise specified in the premium list.

The Premium List

Comprises the following divisions: I. Manufactured produce—machinery. II. Manufactured products—metals. III. Manufactured products—wood, or wood and iron. IV. Manufactured products—animal and vegetable fabrics. V. Chemical and natural products. VI. Food products. VII. Liberal and decorative art. VIII. Fine arts. IX. Horticulture.

The divisions are subdivided into 47 classes, as follows: 1. Steam engines, boilers and appliances—1 gold medal, 5 silver medals, 6 bronze medals, and 5 diplomas. 2. Hydraulic machinery and steam pumps—1 gold medal, 6 silver medals, 4 bronze medals, and 1 diploma. 3. Machinists' tools and metal-working machinery—5 silver medals, 10 bronze medals, and 6 diplomas. 4. Wood-working machinery—1 gold medal, 9 silver medals, 13 bronze medals, and 5 diplomas. 5. Printing and miscellaneous machinery—1 gold medal, 8 silver medals, 7 bronze medals, and 2 diplomas. 6. Mining machinery and appliances—1 gold medal, 10 silver medals, and 3 bronze medals. 7. Laundry machinery—1 silver medal, 3 bronze medals, and 2 diplomas. 8. Fire apparatus and appliances—1 gold medal, 4 silver medals, 1 bronze medal, and 2 diplomas. 9. Marine—4 silver medals, 7 bronze medals, and 1 diploma. 10. Sewing machines, knitting machines, braiding machines and looms—3 gold medals, 6 silver medals, and 3 bronze medals. 11. Agricultural machinery—1 gold medal, 7 silver medals, 20 bronze medals, and 8 diplomas. 12. Iron, steel and lead—4 gold medals, 7 silver medals, 5 bronze medals, and 2 diplomas. 13. Cooking, heating and ventilating—6 silver medals, 1 bronze medal, and 1 diploma. 14. General hardware—1 gold medal, 2 silver medals, 6 bronze medals, and 1 diploma. 15. Fire and burglar-proof safes and locks—1 gold medal and 2 silver medals. 16. Cutlery and edge tools—1 gold medal and 2 silver medals. 17. Grates and mantels, marbles, artificial stone, earthenware, glassware, etc.—1 gold medal, 8 silver medals, 5 bronze medals, and 2 diplomas. 18. Brass work, gas and lamp fixtures, plumbers' good, etc.—1 gold medal, 9 silver medals, and 5 bronze medale. 19. Carpenters', joiners', carvers' and stair-builders' work, ornamental glass painting, etc.—2 gold medals, 7 silver medals. 10 bronze medals and three diplomas. 20. Musical instruments—1 gold medal and 4 silver medals. 21. Vehicles and their attachments, children's carriages, bobbyhorses, etc.—1 gold medal, 16 silver medals and 6 bronze medals. 22. Furniture, upholstery, etc.—1 gold medal, 12 silver medals and 5 bronze medals. 23. Billiard tables.—1 gold medal, 2 silver and 2 bronze medals. 24. Woodenware, brushes, wire goods, willowware, etc.—1 gold medal, 6 silver medals and 3 bronze medals. 25. Boots, shoes, leather, rubber goods, etc.—2 gold medals, 15 silver medals and 5 bronze medals. 26. Hemp, cordage, paper, fure, hair, etc.—2 gold medals, 7 silver medals, 5 bronze medals and 1 diploma. 27. Woolens, dress goods, carpets, cotton, etc.—1 gold medal and 15 silver medals. 28. Gentlemen's furnishing goods, etc.—7 silver medals and 5 bronze medals. 29. Ladies' furnishing goods, dresses, cloaks, millinery, etc.—7 silver medals, 6 bronze medals and 1 diploma.

30. Tobacco—2 silver medals and 3 bronze medals. 31. Chemical and pharmaceutical products—3 gold medals, 14 silver medals, 6 bronze medals and 3 diplomas. 32. Geology, mineralogy, zoology, botany, etc.—2 gold medals, 8 silver medals, 2 bronze medals and 2 diplomas. 33. Groceries, meats, flour, etc.—14 silver medals, 9 bronze medals and 1 diploma. 34. Wines—1 gold medal and 8 silver medals. 35. Liquors and fermented products—4 silver medals and 1 bronze medal. 36. Printing and lithographing, etc.—10 silver medals and 5 bronze medals. 37. Gold, silver and plated ware, watches, clocks, jewelry, bronzes, etc.—1 gold medal, 6 silver medals and 6 bronze medals. 38. Scientific apparatus, etc.—1 gold medal, 8 silver medals and 12 bronze medals. 39. Surgical and dental instruments and appliances—3 silver medals, 3 bronze medals and 1 diploma. 40. Hairwork, needlework, embroidery, shellwork, patterns, etc.—3 silver medals, 4 bronze medals and 41 diplomas.

41. Paintings in oil and water colors—$10 in each will be awarded in this class for the most meritorious exhibits by local artists. The classification of awards is not yet determined upon. 42. Ceramic art—7 silver medals and six bronze medals. 43. Sculpture statuary and carving—8 silver medals. 44. Engravings, original drawings, penmanship, etc.—13 silver medals and 1 diploma. 45. Photography—1 gold medal, 4 silver medals and 5 bronze medals. 46. Plants, trees and flowers—5 silver medals, 9 bronze medals and four diplomas. 47. Fruit—4 silver medals and 8 bronze medals.

In all, there are 648 prizes, besides $1,000 cash, to be distributed among local artists in oil and water colors, as may be determined hereafter; but the managers do not consider the list complete, and any meritorious article on exhibition, not therein mentioned, will receive due consideration.

California Premiums.

Premiums will be awarded for the best display in California make to the following: File cutlery, fire arms, assortment locks, assortment of edge tools, glassware, sample of galvanizing, and sample of electro-plating (done in San Francisco), articles made from California wood, turned articles from California wood, plate-glass mirror, string or reed instruments, backs, single top buggy, open buggy, hotel coach, double buggy, sulky, stage coach, brooms, general display of boots and shoes, ladies' and misses' hand-made shoes, men's hand-made shoes, machine-made boots and shoes, sole leather, fair leather, kid leather, morocco leather, calf skins, leather belting, rawhide goods, leather hose (100 ft.), lasts, bale of hemp, imitation hair, cordage, paper, paper rags, paper boxes, dress silks (25 yards), ribbons (10 varieties), manufactured silk, thread and twist, woolen goods, mats and matting, oil cloth, weaving, gentlemen's furnishing goods, umbrellas and parasols, gloves (goat or buckskin, and kid), ladies' corsets, buttone and fringes, cigare, cigarettes, finecut tobacco, acids, candles, glue, shoe-blacking, writing fluid and mucilage, matches (quality and variety), coals (Pacific coast), fossils (ditto), petroleum, crude and refined, largest and most comprehensive collection of natural products of the Pacific coast, refined sugar, butter and cheese, hams, bacon and lard, codfish (cured), best general display of wines, best of sparkling, still, dry, white, sweet, port and claret wines, and cider, grape brandy, printed sheet music (done here), solid silverware, watch or clock, show cases, surveyors' instruments, hand-made lace work, specimen painting on pottery, painting on porcelain, wood engraving, mechanical drawing by a pupil of the public schools, architectural drawings, generally by pupils of public and private schools of this city, landscape photography, raisins, etc.

A Wonderful Copper Region.

We have before us a number of specimens of ore from the copper mine recently purchased by D. H. Jackson in the Walker River region. Among these are blue and green carbonates, sulphurets, native bluestone, some native copper, and indeed copper in almost every form in which it is ever seen. When purchased by Mr. J. the mine was known as the "Bluestone copper mine." The owner, a Walker River ranchman, had for some years been engaged in digging out the ore and sending it by wagon to Dayton, where it was sold to the company engaged at that place in the manufacture of bluestone.

There is a whole mountain of ore, and much of that taken to Dayton was dug from a pits sunk at various points. When a pit became so deep that the ore could no longer be conveniently shoveled out it was abandoned and work commenced in a new place. In this way a number of holes have been sunk for a distance of about 1,500 ft. east and west and about 1,000 north and south.

While the whole surface of the mountain seems to be covered with ore, a close examination shows the appearance of two great veins, one running north and south and the other east and west. Where the ledges cross each other all is a mass of ore for a great distance in every direction.

The only approach to regular mining made by the former owner of the mine was at this point where the veins appear to cross. Here a tunnel has been run for a distance of about 50 ft., from the end of which ore has been dug out in all directions, columns being left to support the roof. The place is said to look more like a great cavern than a mine. The columns left are from three to six and eight ft. in diameter, and Mr. J. says a four-horse team might be driven in among them. This cavern is so dry and so well ventilated that several of the miners sleep in it. It answers very well as a sleeping place if no dust is kicked up. The dust is bad and when inhaled it excites coughing.

Native Bluestone.

A wonderful feature of this mine is the vein of native bluestone found in it. Some years ago, when the mine was first discovered, very few persons could be made to believe in the native bluestone. When shown specimens of the article most experts pronounced them bogus. They declared that bluestone (sulphate of copper) was a manufactured article, and men might with as much reason come in from the wilds and assert that they had discovered an indigo mine.

However, the native bluestone is no myth and is there in abundance. It lies in a horizontal bed or stratum from 10 to 12 feet in thickness, and forms the roof of the tunnel mentioned above. Much of it is just as bright and pure as the manufactured article, but the great mass has little seams of clay running through it. At one time the owners of the mine broke down and picked out several tons of the pure article, but when they hauled it to Dayton the price allowed them was less than they thought they should have received; therefore they mined no more of it, and several hundred pounds left on the ground is still there, but bleached out till quite white.

To refine this native bluestone would be a very easy matter. It would only be necessary to dissolve it in a large tank, when the clay and other foreign matter would sink and the solution of copper could be drawn off and recrystallized, or it might be precipitated, and at once changed into metallic copper.

Present Operations.

Mr. J. has some 10 men at work at the mine and has been sinking a shaft that was started by the former owner. This shaft is down 100 ft., and crosscuts are being run to define the vein and learn something about its width. At and near the surface the ore is from 15% to 40% copper, but at the depth of 100 ft. it averages over 50%.

A Mass of the Metal.

There is a rude old furnace near the mine, and during his recent visit Mr. J. fired up on this and smelted a lot of the carbonate ore, allowing the metal to run out and form a mass on the ground. This mass is some four ft. long, over three ft. wide and about a foot thick. Mr. J. has no idea how much it will weigh. He arranged with a teamster to haul it into this city en masse, but the teamster wrote that he was having trouble with the lump. He managed to get it upon his wagon, after much trouble, but it broke the wagon down. The man with this copper elephant on his hands wrote to know if Mr. J. would not allow him to cut it. Samples cut from corners of this mass, now on exhibition in this city, appear to be as pure as any of the copper of commerce.

Mr. J.'s mine is only about two miles from Walker river, and on the river he has secured a piece of ground on which to put up furnaces, there being an abundance of water-power for running all kinds of machinery.

The Ludwig Mine.

The Ludwig mine, a few miles from the Jackson mine, is another wonderful mineral deposit. The vein is an immense one, and it not only produces copper, but is also rich in cobalt and nickel. At this mine there are now piled up on the dump from 4,000 to 5,000 tons of copper ore of the richest character. The owner of the mine has been for some years, off and on, hauling this ore to the bluestone works at Dayton. In all he has received for ore delivered at said works a little over $120,000. This was at just such prices as the owner of the bluestone works saw fit to pay for the ore, as there was no other place to which it could be taken for sale.

The ores of cobalt and nickel are found in strata next to the footwall, and can be separated from the copper ore without trouble. They have piled up at the mine several tons of cobalt and nickel ores. These ores came out in taking out the copper ore, and there being no demand for them they were thrown aside for "future reference," and they still lie uncalled for.

In this Ludwig mine there is a great deal of native copper—much more than is seen in the Jackson mine. The owner is a ranchman, and the mining that has been done is of the same kind seen at the Jackson. We have before us a beautiful specimen from the Ludwig mine. On one side is a layer of the cobalt ore, on the other a slab of green carbonate and in the center a ribbon half an inch in width of pure, bright blue carbonate.

Other Mines

Of copper similar to those described to the number of about a dozen are found in the immediate neighborhood. A little work has been done on some of them by the ranchmen living in the vicinity, while on others there is to be seen hardly the scratch of a pick. It appears that for some years the owners of the ranches out along the valley of the Walker river have been in the habit of going to the mines when they stood in need of a little ready money. All they had to do was to dig the ore, load it upon their wagons and haul it to the bluestone manufactory, when their coin was won.

The new railroad to Candelaria will pass through the heart of this copper region—it will go within seven miles of the Jackson mine—and Mr. Jackson is of the opinion that it would be a good speculation for some capitalist to put up first-class reduction works at some central point on Walker river for working copper and all other kinds of ore, there being mines that are quite rich in gold and silver.—*Territorial Enterprise.*

Empire District, Arizona.

This much-talked-of district is located southeast of Tucson about 25 miles in a straight line, and by road; it embraces that scope of country lying between Davidson's canyon and the Whetstone mountains, and can be reached from the Cienega station, in a direct line within six miles, and by the road which leads to Patagonia, within ten miles. The southeastern portion of the district is bounded by the Cienega valley, which flows a large and constant supply of water. The most attractive feature is the large mineral veins which traverse the district, the showing of which is, without question, the most wonderful of any yet discovered in the Territory. The formation is porphyry and lime. Most of the veins thus far developed show iron and lime cappings, intermingled with chlorides. As depth was reached a fine showing of horn silver has been made.

The Total Wreck and Justice mines are the best developed in the district; both show up large bodies of rich ore.

The Ophir presents a good appearance, as also do a number of other claims in that neighborhood. It is in the Empire district that some of the oleaginous capitalists have staked out bonanzas, prominent among which are the rich finds of Captain Weeks, including 13 mines.

The surface showing of the New York, Yorkville, Chancellor, Black Hawk and Nigger Ben mines are very large,—in fact larger and richer than anything we have seen or heard of in the many interesting discoveries made during the last two years. The New York has four distinct parallel ledges, the croppings of which run from six to eight feet in width. A shaft 12 feet deep on ore of three veins shows a solid ore-body from the top to the bottom. The ore is chloride, with a considerable scattering of horn silver. This shaft is sunk on the summit of the New York hill, which is more than a 1,000 ft. above the surrounding country, on a ledge which runs along its crest. The Yorkville, an extension of the New York, is of the same character, with two shafts. The Chancellor is a parallel claim with the Yorkville, and has bold croppings, the average richness of which is high. The Black Hawk is a mine of mammoth veins, and looks like a mountain of ore. The Nigger Ben is the south extension of the Black Hawk, and bears the same character in its surface showing. The remainder of the group all show up grandly. The average richness of the different kinds of ore taken from all these claims runs from $131 to $1,030 in silver, some showing gold in paying quantities. Taking into consideration the amount of ore in sight, it is safe to predict that Empire district, within a very few months, must, without question, be a great bullion-producing center. Its close proximity to the railroad, water being found in abundance all through the district, and the milling facilities excellent, ensure this. Tombstone two years ago made no such a showing as the Empire does to-day.—*Arizona Star.*

MECHANICAL PROGRESS.

Steel Making in China.

In the manufacture and use of steel, as in other symbols and aspects of civilization, the Chinese appear to have attained a very early and remarkable proficiency. Mr. Jeans, in his recent work on steel, says that unfortunately Chinese records do not enlighten us as to the precise period at which the art of reducing metals from their ores became known in that country, but it is evident that it must have been some centuries before the Christian era. It is not, indeed, unreasonable to conclude that this knowledge was at any rate concurrent with, if not antecedent to, the discovery of the attractive power of the loadstone, which seems to have been used by the Chinese in the reign of the Emperor Hoangti, about 2600 B. C. Mention made of steel in the most ancient of the Chinese writings, and Leih-tze, an author who flourished about 400 B. C., describes the process by which it was made. In the Yu Kung section of the Shoo King, Book I., it is stated, that among the articles forming the tribute of Yu., were nautical gem stones, iron, silver, steel, stones for arrow heads, etc. Legge points out the difference of soft iron, and hard iron or steel, as distinguished by the Chinese, and remarks that in the time of the Han dynasty, ironmasters were appointed in several districts of the old Leangchou to superintend the iron works. With the exception of this passage, however, it is considered probable that there is no distinct allusion to iron in Chinese writings older that 1000 B. C. In describing the manufacture of steel in China, the Pi-tan, or Pencil-Talk, states that wrought iron is heat or twisted up, and unwrought iron is thrown into it. It is then covered up with mud and subjected to the action of fire, and afterward to the hammer. On this passage, Day remarks that it comes remarkably near describing the process of immersing wrought iron either into molten cast iron, or heating it with iron ore and fuel covered over with layers of mud or clay, to exclude, as much as possible, the oxidizing influence of the external atmosphere. At a subsequent period the Chinese records describe the different kinds of steel produced. That obtained by the first process they call ball steel, *Twan Kang* (from its rounded form), or sprinkled steel, *Kwan Kang* (from the pouring of water). Another kind is spoken of as "false steel," "wei tee," and it is quaintly added that "iron has steel within it, as meal contains vermicelli." In the "Peut Saow" (a work of the Ming dynasty), again, three kinds of steel are described, thus: "1. That which is produced by the adding of unwrought to wrought iron while the mass is subject to the action of fire. 2. Pure iron many times subjected to fire produces steel. 3. Native steel, produced in the southwest, at Hai Shau, and which is like in appearance to the stone called *Tsze-shit-ying*—purple stone efflorescence." Steel continues to be manufactured in China to the present day. James Henderson, a commissioner of Li-hung-chang, the Governor-General of Chilili, and minister of the young King of China, states that "the steel which comes to Tien-tzin from the upper Yangtsee is highly prized, and bears much higher prices than the Swedish steel imported into China.

HARDENING AND TESTING.—To really test the hardness of the surface of metal, we must take a new or at least a good, dead smooth file and apply one corner of it to a corner rather than on a flat surface of the metal to be tested, pressing the file very firmly against the work. A coarse file, even if a new one, is useless to test with. The greatest degree of hardness is obtained by plunging the red-hot steel into mercury. Steel hardened from the surface inward is hardest on the surface, while in steel that has been tempered the exterior is the softest. In the one case because the surface was cooled in advance, in the other because it was heated in advance. Files are hardened in the following mixture: 2 parts (by weight) of salt, 15 parts of rye grist, and 30 parts of burnt cow hoofs, all ground together and mixed with a sufficient quantity of water to make a pasty mass, with which the files are covered. When dry, they are placed in a fire. If, during the heating, the coating should drop off at certain places, the files are promptly withdrawn and the place exposed is covered with dry hoof powder. It is returned to the fire, where it is left until a temperature is reached which best suits the steel of which it is made. Then the file is plunged vertically into the bath, care being taken not to move them to the right or left, as that would cause warping. The bath is made in the following manner: 28 parts of salt are dissolved in about 5 parts of water, to which a handful of iron scale is added. The tongs are softened by being plunged into red-hot lead.

RULE for finding the weight necessary to put on a shaft valve lever, when the area of valve, pressure, etc., are known: Multiply the area of the valve by the pressure in pounds per square inch; multiply this product by the distance of the valve from the fulcrum; multiply the weight of the lever by one-half its length; then multiply the weight of the valve and stem by their distance from the fulcrum; add these last two products together, subtract their sum from the first product, and divide the remainder by the length of the lever, the quotient will be the *weight* required.

The Ultimate Applications of Steel.

The more the subject of the manufacture and uses of steel is inquired into, the more does it seem incapable of exhaustion. Great things have been accomplished in the past, but much yet remains in the future. The manufacture of steel is far from finality. Even now some of the leading steel works in France are essaying the production of ingots of 100 tons weight. Steel, indeed, may be compared, in reference to its multifarious uses, with the elephant's trunk, the adaptability of which enables it with equal ease to pick up a needle or to pull up a tree. High authorities have expressed the opinion that steel will have the future nearly altogether to itself, displacing copper for fire-boxes, etc., silver for articles of ornament, and lead for purposes of softness, as much as it is superseding iron in respect of utility, economy and endurance. And as it is difficult to set bounds to the ultimate applications of steel, so it is impossible to limit the means of its production. Recent metallurgical progress has indefinitely increased the resources available for the latter purpose. Science has at last found a method of ridding of their deleterious contents the ores of iron heretofore unsuited for the manufacture of steel, and henceforth, if metallurgists of experience are not greatly deceiving themselves, the cheapest and most plentiful ores will, by one of the greatest chemical triumphs of the age, be raised to the same rank as the richer, and comparatively limited ores that have alone been deemed fit for the steel manufacture until now. The horizon of the future, therefore, is not bounded by any limitation of the supplies of raw material. Nor is it any more likely to be measured by the uses of steel, for they are multiplying every day, and as the manufacture is cheapened and improved, so will the applications continue to increase. In the track of this movement many changes must follow, and have even already occurred, of which we have been able to take but scant cognizance. The hard and irksome work of the puddler has been superseded by less arduous and, in the main, by less skilled labor. One of our greatest authorities has calculated that to convert fluid cast iron into steel, the labor required is only about one-third of that required to convert pig metal into wrought iron, while the fuel consumed is only about one-fourth of that formerly used. The economy of coal is, therefore, another important corollary of the advance of steel, and this economy, great though it be in the aggregate, is trifling in comparison with that accomplished through the greater strength and endurance of that which we are fully justified in describing as the metal of the future.—*J. S. Jeans, Secretary of Iron and Steel Institute.*

SELECTING TOOL STEEL.—Hardness, tenacity, facility of working under the hammer, and of receiving temper, are requisites of good tool steel. The presence or absence of some of these qualities cannot be ascertained except by actual experiment; yet good judgment will enable a man to ascertain, with an approach to accuracy, the quality of steel without subjecting it to the action of fire and water and the hammer. Pure iron contains no carbon, but tool steel contains from 1% to 2%. So small is this amount, that it is not surprising that it requires judgment and experience to select steel in the bar. One of the tests is to apply a drop of nitric acid to the surface of a fresh fracture. It will leave a black stain on good steel, but not on iron or low steel. Another test is to observe the color and texture of a freshly made fracture. This should present a fine grain, with a dull silvery luster, and of uniform color. Poor steel may show a close grain, but it will be mottled in color. But the only sure test is in working the steel. Draw the end of the bar, heated to a cherry red, under the hammer, to a fine point. If it will admit of being so pointed, that is a good indication. Plunge it into the hardening bath while hot; and, when chilled, give it a few gentle blows with the hammer. If it is tough and does not fly, but requires some hammering and bending back and forth to break it, that is another good indication. If the fracture shows a fine, even, lively grain, the test is complete, and the workman may be satisfied. One of the best of tests is to make and temper a cold chisel from the bar. If it stands well the chipping on a casting, the steel will make good turning tools. But, after all, the good judgment of the experienced forger is worth more than empirical tests.

INTERNAL EFFECT OF HAMMERING METALS.—If an iron bar be held in the line of the dip of the magnetic needle, and struck upon the upper end with an ordinary hammer, it will become polarized, one end repelling, the other end attracting the magnetic needle. Reverse the bar, and strike it on the opposite end as many blows as before were given, and both ends will attract the magnet. Give two or three more blows, and the bar shows magnetic effects the reverse of those first obtained. Something, therefore, has occurred in the bar due to hammer impact, and the recognition of this makes it in a measure apparent why the compass needle in iron ships may be affected in consequence of the tremor to which the vessel is subjected owing to blows of the waves.—*Appleton's Cyclopedia.*

RAILWAY SLEEPERS.—The Belgian Government is reported to have decided upon the abandonment of wooden railway sleepers, and the adoption, instead, of those of iron, an example which it is thought will be largely imitated.

SCIENTIFIC PROGRESS.

Preservation of Iron Against Rust.

We have repeatedly called the attention of our readers to various systems which have been devised for the preservation of iron against rust. According to *Engineer*, Mr. George Bower, of St. Neots, appears to have made this matter a subject of pretty thorough study and experiment, with the following results: It seems that Mr. Bower has found that the magnetic oxide which, being proof against atmospheric influence, is sought to be produced on iron surfaces for their protection against rust, is really a secondary product. The sesquioxide of iron, a lower oxide, is first produced, and this is subsequently converted into the magnetic oxide. According to the *Engineer*, the process is extremely simple. An oven is constructed large enough to contain, say, a ton of the articles to be coated. In connection with this oven is a gas producer, somewhat similar to that of the Siemens. Any required quantity of air can be admitted (the air being previously heated to a high temperature) to the oven, which accordingly can be filled either with carbonic oxide from the gas producer or with carbonic acid, or with carbonic acid and an excess of oxygen, at pleasure. After the articles have been placed in the furnace, air mixed with carbonic oxide is freely admitted for some time, the carbonic oxide taking up another atom of oxygen from the air and becoming carbonic acid with evolution of heat. The excess of air in the furnace or oven supplies oxygen to the iron, which becomes coated with sesquioxide of iron. After a time the supply of air is shut off. The carbonic oxide then apparently abstracts oxygen from the iron, and the sesquioxide becomes magnetic oxide.

Curiously enough, and for some unexplained reason, the most uniform results are obtained, not, as might be supposed, by first establishing a coating of red oxide of the required thickness and then converting it all at once, but by admitting and shutting off air alternately at regular intervals throughout the process, which lasts from 8 to 10 hours. The consumption of coal is about 5 cwt. per ton of small castings coated. No skilled labor is required, as even if too much air is admitted no harm is done. The only duty devolving on the attendant is to fill the oven, to lute up the door, to attend to the gas producer and to move a handle between two fixed points half a dozen times in the 10 hours. Any handy furnaceman could learn how to work the process in two days. The construction of the oven and the gas producers is said to present some ingenious features of detail essential to the successful operation of the process, which, it is claimed, yields uniform results. The color of the oxide resembles that of lead, and, judging from earlier specimens which have reached this country, it does not appear to us sufficiently effective to be admissible for most purposes without a coat of paint.

FOSSIL BUTTER.—At a late scientific meeting in London, Prof. Church read a paper on a sample of butter, which must have lain for many centuries, buried in an Irish bog. Its probable age was judged to be about one thousand years. The sample contained nearly four per cent. of curd, which consisted partly of vegetable matter derived from the bog, but contained quite enough animal matter to prove that the butter had been originally made from animal milk, and was not a mere artificial fat. Its fatty character had, however, been entirely changed, and the glycerides of which the fat had originally consisted had been decomposed so as to leave simply a mixture of the fatty acids, which constitute the acid portion of animal fats. The butter had, in fact, become changed into a substance closely resembling in character and composition the substance of which good composite candles are composed. The result is singular, as showing that length of time, combined with exposure to moisture, will effect the decomposition which the manufacturer of stearine has to effect by the agency of heat and acids. At the same meeting another paper was read on a sample of still older butter, which had been taken from an alabaster vase in an Egyptian tomb. It had evidently been melted and poured into the vase, and carefully sealed over. This sample was probably about 2,500 years old, but the preservation had been so perfect that it was only slightly rancid, and had fully retained the chemical properties of genuine butter, the fats not having been decomposed to any sensible extent. This sample possessed a decided taste and smell of butter, while the sample from the bog was cheesy rather than buttery in smell.

A JAPANESE INVENTION.—The Japanese have devised a new process for photo-engraving, which is described as follows: A substance is used in making Japanese lacquer which becomes as hard as stone when exposed to the action of sunlight. A slab covered with this material is exposed 12 hours to daylight, which is allowed to pass through the "negative" plate placed in front of it. By this time the slab has become hardened to different degrees, according to the intensity of the light falling on it, or in other words, according to the light and shade of the negative in front; and upon carefully scraping away the softer parts a pictorial surface in low relief is obtained similar to an engraver's block, and suitable for printing from.

Natural Lime.

Among the recent discoveries is "natural lime," which occurs in Kansas. It is found in large beds; is of a fine, white color and very fine in texture. It is also soft, smooth and readily converted into a plastic condition by the addition of sand and water. The mortar thus made has apparently the same qualities as the best made from superior "burned lime" from the kilns. It sets and hardens quickly and turns very white.

This discovery brought out the query as to whether such a strange product as this occurs in any other section of our continent. In answer the *Scientific American* gives a letter from Wm. M. Pierson, of Fort Bayard, N. M., in which that gentleman says: "I answer, yes. From 1870 to 1874, I was U. S. Consul at Paso del Norte, Mex., and, while prospecting for silver ore, I discovered a large deposit, in what miners term pocket formation, of natural lime, located in blue limestone, in the foothills, one and one-half miles west from the city of Paso del Norte, Mex. I gave it various trials, and found it to possess all the good qualities of manufactured lime, and for whitewashing far superior to the manufactured article."

IMPROVED METHOD OF MANUFACTURING NITROGLYCERINE.—The French Academy of Science have awarded a prize of $500 to Bouhing & Foucher for an improved and less dangerous method of manufacturing nitroglycerine. This method has been for some time in actual use at Vouges, France, without meeting with any accident. The process is described as follows: In the old method, in which fuming nitric acid or a mixture of it and nitric acid is made to act on glycerine, and the mass is suddenly immersed in water, the reaction often produced heat sufficient to decompose a part of the nitroglycerine, occasioning violent explosions in spite of the refrigerating processes adopted. The principle of the new process consists in obviating the greater part of the heat by first engaging the glycerine in combination with sulphuric acid, forming sulphoglyceric acid, and then destroying slowly, by means of nitric acid, the sulphoglyceric compound. Two liquors are prepared in advance—a sulphoglyceric and a sulphonitric, the latter with equal weights of sulphuric and nitric acids. As they heat considerably they are allowed to cool, and are then combined in such proportions that the reaction takes place slowly. In the old method the nitroglycerine is separated almost instantaneously, and rises in parts to the surface, rendering washing difficult. In the new method it forms in about 20 hours, and with a regularity which prevents danger. It also goes to the bottom, and can be washed rapidly.

PASSIVITY OF IRON.—Concentrated or fuming nitric acid does not corrode iron; on the contrary, when iron is dipped into it, it acquires the singular property of resisting the attacks of diluted acid. The fuming acid is said to render the iron passive. Dumas first called attention to this fact in his lectures. It was afterwards studied by the elder Becquerel, de la Rive and others, who offered various hypotheses to account for the phenomenon. It was commonly thought that a film formed on the surface of the metal, consisting either of an oxide or of an insoluble nitrate, which constituted a sort of varnish and thus prevented any further attack. L. Varenne has found that the passivity depends in great measure upon the degree of condensation in the metal, but that in all cases it may be overcome by shocks, and even by extremely feeble vibrations which are excited by the action of an electro-magnet. Moreover, a current of gas, even though very feeble, usually destroys the passivity. Varenne finally concluded that the phenomenon was entirely due to a gaseous film on the surface of the metal, and his belief was confirmed by finding that the passivity ceased entirely in vacuum. He thinks that the film consists principally of gaseous nitric oxide. He proposes to extend his researches, in order to find what are the causes which lead to the formation of the film, and what is the nature of the influences which afterwards maintain its adherence.—*Ann. de Chim. et de Phys.*

SAFETY LAMP UPON A NEW PRINCIPLE.—Herr Koerner, a student of the Freiberg School of Mines, proposes to prevent colliery explosions by the use of a lamp which embodies an interesting novelty. Its action is based upon the property of the platinum black, of condensing on its surface not only oxygen, but also light carburetted hydrogen. In a wire gauze chamber are placed pieces of pumice stone impregnated with platinum black; and as all the air for maintaining the combustion passes through the chamber, all the fire-damp is destroyed before it reaches the open flame.

A NEW THERMO-ELECTRIC PILE.—M. Clamond a French electrician, is reported in *La Nature* to have devised a *thermo-electric pile* upon a novel principle, which is capable of yielding electrical currents of considerable tension. A large instrument of this kind has been successfully employed to run several electric lights.

ANTHRACITE IN EUROPE.—Recent analysis of the *anthracite coal of Valois*, Switzerland, show a very close resemblance to that of Pennsylvania. Trials with American heaters show that it can replace the Pennsylvania coal. It has also been successfully tried on locomotives.

The Tendency to Processes.

Scarcely a month passes in which there is not somewhere an announcement of the discovery of a new process for the more successful and economical reduction of silver and gold ores. And it is a noticeable fact that the process rarely comes from the laboratory or anyone well grounded in the science and practice of metallurgy, but generally from the much-vaunted "practical" man.

Our miniug centers, especially the new ones, literally swarm with process-men, and their processes invariably savor of the miraculous. There must be a fascination in the business, for the tendency to discover a process for the improved treatment of the ores of the precious metals, seems to be confined to no class or calling. The number of men who can save all the gold or all the silver is legion. No one is safe from the seeming mania. Even the active-brained and ingeuious Edison is diverted from his apparently absorbing experiments with his electro-chemical lamp, to the thinking out of his elcctro-chemical process for the extraction of gold from the mnch-manipulated tailings of placer and gravel claims. And we hear that some one is about to pitch out a process for the use of the water of Mono lake in beneficiating ores. As we have said, processes are generally rife in the newest mining regions. Several years ago the writer went to Colorado, to introduce a new furnace and process. It was up hill work, for that mining community has been processed beyond its credulity. Dilapidated and abandoued works, containing fragments of incomprehensible machinery, were met in nearly every district. One morning in Central City he attracted the attention of a group of men, one of whom asked who the stranger was, and got this reply: "That fellow is our latest saviour and has brought us a new plan of salvation. He is the last furnace-and-process man."

The question occurs: Is there actual ueed for a twentieth part even of the new processes? The operation of extracting the gold from ordinary ore is simple enough and withal satisfactory; and the more complex combinations are snccessfully treated by well-established scientific methods. The reduction of silver ore is a nicer and more difficult matter and demands the largest science and skill. Yet a well known writer on the metallurgy of silver, remarks, "that the earliest method of obtaining silver from its ores, of which we have any knowledge, bears an astonishing resemblance to that in vogue at the present day," and to add point to his remark the writer quotes from the prophet Ezekiel: "As tbey gather silver, and brass, and iron, and lead, into the furnace, to blow the fire upon it, to melt it." The application of cbemical science to tbe operations of metallurgy has led to precision, economy, and almost the minimum of loss. But the largest saving and economy have been obtained by mechanical devices, some of tbe most important of which have been introduced of late years. Here is the real field for the man of inventive faculty, and if such one feels bimself stirred by the impulse of invention let him evolve a new machine; some device to better pulverize, or roast, or amalgamate, or smelt, or concentrate, or lixiviate ores. A device adapted to achieve either of these purposes would confer practical good on the metallurgist and would greatly benefit tbe inventor.

The average process, which generally involves profound cbemical principles, is usually tbought out, but seldom wrought out, by the self-made man. The tendency to processes for treating ores of the precious metals comes from that "little knowledge" which is dangerous. A carefnl study of some standard manual of metallurgy—some hand-book, say like Kustel's "Roasting of Gold and Silver Ores"—would cause many a man to discard his idea of seeking for a new process; would save tbe profession of metallurgy from much discredit, and would prevent the waste of untold thousands.

The Mining Share Market.

Excepting a brisk demand for several of the Bodie shares the transactions in the market differed very little from those reported last week. So far as the Comstocks are concerned the only apparent policy of the managers is delay; if it is so, it is to be hoped that the inactivity will prove to have been masterly. The shares of those mines are now conspicuous for tbeir dullness. The Bodies continued in demand for several days, and prices were maintained against large sales, but they finally broke sharply, and tbe market closed weak and dull.

No changes on the Comstock have been reported from Virginia City, beyond the statement that it will be fully two weeks before the main line of pumps will be in operation down to the 2500 level of the Union shaft, and that when the pumps are in form a drift will be started for the 2500 station of the Sierra Nevada, in running which it is believed ore ought to be found.

During the week favorable reports were received from several mines in Bodie—uotably Belvidere, Mono and Goodshaw—and the promise of the district is large. In Columbus district also valuable developments are reported, and its shares are attracting renewed attention.

MINING SUMMARY.

The following is mostly condensed from journals published in tbe interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MAHONEY MINE.—*Sentinel*, June 2: The men who were on duty at the Mahoney mine for 8 years, guarding the mine, have received their discharge. S. D. R. Stewart has gained possession and will probably start the mine in operation at an early day; and it is reported that a 20-stamp mill will soon be built for the mine.

AMADOR QUERIES.—*Dispatch*, June 6: This is tbe name by which the quartz mine now being developed by Morgan & Co., in Hunt's gulch, is now known. The shaft is now down about 100 ft, at which depth they have a 5-ft ledge of excellent rock, and the ledge continues to widen as they go down. We hope soon to report the commencement of the orection of a splendid mill on the premises.

PLACER MINES.—*Ledger*, June 5: More work has been done in gravel claims around Pine Orove this season thus far than for years. Quirolo & Co. have an hydraulic claim in full blast. The Grass Valley claim is running a good force, under the management of J. Bradshaw. J. T. Wheeler is operating a claim near the Grove. W. P. Hayes and others have been employed through the winter on a placer mine on the Hanly ranch, this side of the Grove. All these claims seem to be turning out satisfactorily.

BUTTE.

WYANDOTTE MINE.—*Mercury*, June 4: Supt. H. E. Winslow started the Cranston elevator to work on the ground of the Wyandotte hydraulic gold mining company Friday. Large returns are anticipated, the bauk of gravel being regarded as exceptionally rich.

ITEMS.—It is reoorted that new mines are being opened near Dry Creek. The new sbaft of the Pacific goes on contract to-morrow for 100 ft.

BLACK SAND DEPOSIT.—Many years ago tbe Blue Gravel company ran a tunnel into a hill located about 2 miles from Dogtown. They encountered a large deposit of black sand, and after digging through it a distance of 350 ft, ceased operations and began anow in another direction. Last fall, Major McLaughlin sent a lot of the sand East to Edison. Saturday last he received a dispatch from E. askiug for further information regarding the deposit, and requesting that another lot of the sand he sent on. Monday the Major again visited the property, took out 60 lbs of the sand and takes it East with him to-morrow. The dispatch, though stating nothing positive, was couched in such language as to warrant a belief that the sand is very rich in gold. Mr. McL. says there are millions of tons of the article, and that it can ho obtained at a comparatively trifling cost.

CALAVERAS.

MINING NOTES.—West Point Cor. *Chronicle*, June 5: Once more our quartz mills are grinding and crushing out the precious metal; all are busy—no idlo men, no idle mills. Our mines are turning out good, and capitalists appear to he pleased by their prospects. There are at present 4 outside companies working in this district, viz., the Louo Star company, Anderson Flat, Enterprise and the Hunter's Flat gravel company, all of whicb are above par. Tbo Champion mine is stoping out its treasure again. Ferhur & Co. have struck very rich rock in the Lockwood mine. O'Neil & Co. have struck a new pay chute in the Lone Star, which is being largely developed under their nanagement. Porteous & Co. have struck good placer diggings at Bummerville. C. Brown and J. Bardsley are taking rich rock on the old Whisky lode.

GRAVEL MINES.—The claims are all in full operation, and the chances are extremely favorablo that they will remain so the balance of the season. We shall ho able to report the biggest clean-ups over made in Calaveras county within the next month.

EL DORADO.

MINING NOTES.—Spanish Flat Cor. *Republican*, June 3: Lumber is being hauled past here every day to erect a 10-stamp mill on tbe Chapparel mine, in Kelsey district. I have seen 3 ounces of gold dust, sold to T. F. Lewis by Jo. Smith, of Dry Creek, the handsomest I have ever seen taken from one claim. He says there is plenty more there just like it. An Indian brought in a piece of gold to-day which he took from a piece of quartz rock. It was very thin and flat, and weighed a little over $2—a good prospect in quartz.

GREENWOOD MINES.—Cor. *Republican*, June 3: Prospecting on various mines is being prosecuted with more or less activity. Mine owners are doing their own work very generally; chiefly running tunnels. Mr. Leavitt will commence work in the morning on a quartz mine below town, which he has lately bonded.

RINGOLD MINE.—*Democrat*, June 5: The Ringold company is pushing along on the old Epley. A little engine has been placed in position at the hoisting works. The old shaft, which is 240 ft in depth, is being repaired as the removal of the water progresses. It has been retimbered to a depth of 30 ft. The hoisting ie done with iron buckets and a steel cable. A substantial building is being erected over the shaft. A quarter of a mile south of shaft No. 1 is a second shaft, which has heen sunk to a depth of 30 ft. Work will be resumed here, also. At this point, for a distance of several hundred ft, the croppings are from 8 to 14 ft in width. Land for a mill site has been purchased from Mr. Albright. The mill will probably be ready as soon as the mine has been thoroughly opened ready for the extraction of ore.

A RICH STRIKE.—The parties who are driving a tunnel into Cedar hill, west of the Diekerhoff mine, have struck a spleudid channel of auriferous gravel. Those who have examined the ground, think it a lead never before touched. It is believed it will yield $3 per car hy washing, and would be still more profitablo if crnshed.

PROSPECT FLAT.—The owners of this mine have good reason to be satisfied with the outlook. We understand their clean-ups are improving every week. They are now stoping pay gravel of such depth that only a portion can be worked on account of the difficulty of timbering. Between Coon Hollow and White Rock there is 10 miles of channel of which not one-tenth has been thoroughly prospected. Good pay has been found all along wbere work bas been done.

ROSECRANS MINE.—This mine is 1½ miles from Garden Valley; its shaft is 100 ft deep on a 4-ft ledge. They are now taking out some excellent ore, much of which prospects as high as $200 per ton of free gold. Tbe sulphurets are of high grade. They are running 2 shifts of 4 men each. The ledge ie nearly perpendicular, dipping slightly to the west. The quality of the rock improves in depth. Tbe main building over the hoisting works is 60 by 36 ft. The hoisting engine is 45-horse power, the pumping engine 20 and the engine in the mill 60-horse power. There are 3 compartments at the entrance of the shaft, 1 each for hoisting, cage and pump. Some 50 yards below is a 10-stamp mill, favorably located for receiving the quartz, wbich is run on a track from the mine. Tbe mill will start up in a few days with 200 tons of ore on hand. These works are all new and first-class in every respect, having been put up last summer.

FRESNO.

RICH DISCOVERY.—The *Republican* of a recent date says there is great excitement ou Sycamore creek, 8 miles from Fresno, over the discovery of a gold and silver-bearing ledge 11 ft thick, and assaying $30 in gold per ton, and is rich in silver. In early days there was a great deal of gold taken out of Sycamore creek hy placer miners, and the stream has heen worked more or less ever since. The gold found in tbe bed and bars of the creek did not appear to have been washed any great distance, and many old miners who have worked tbose placers have heen confident that a rich ledge was yet to ho found in that vicinity. Our informant says the lately-discovered ledge is located for a distance of 6 miles.

LASSEN.

COOK'S CANYON MINES.—Cor. *Advocate*, June 5: Cook's canyon comes into the north arm of Indian valley, between Taylorville and Mountain Meadows, and gives name to this mining district. These mines were discovered by a man named Rider, 3 years ago, and have been worked continuously since, when sufficient water could be procured to wash the gravel. There are now 5 claims or companies at work in full blast, and it is expected that this season's work will prove very remunerative. Good wages have been made in the district heretofore, but the owners of the claims have been compelled to expend all they made in digging ditches, building flumes, etc. A rich channel was struck in the Rising Star claims, owned by G. A. Chipman, on the 20th of May, which prospects as high as 10 to 20 cents to the pan. The gold is fine, and therefore there has been much loss by reason of the primitive methods employed, but improved appliances are now being used. A project is on foot to tap Caribou lake, some 12 miles distant, and when this is accomplished, water will be plentiful for quite a long season's work. There are at present about 20 miners in the district.

MARIPOSA.

ENTERPRISE MINE.—*Gazette*, May 29: This mine, which is located in the neighborhood of Hornitos and the Washington mine, is putting up some extensive works. The ore taken out is immensely rich. Between 15 and 20 men are working at the mine. The owners are contemplating putting up a 40-stamp mill.

MONO.

BODIE DISTRICT.—*News*, June 2: On the 500 level of the Belvidere the main south drift is in 113 ft; progress during the week, 30 ft. The ledge is fully 4 ft wide between the walls, one-half of which is good ore.

TIOGA.—Supt Golding reports: Since last report our west crosscut, 800 level, has been advanced 30 ft. The face still continues to show clay and quartz mixed, yielding assays ranging from $4.84 to $20.64 in gold and silver per ton.

NOONDAY.—Supt. B. B. Taylor reports May 20th: The south stope, 200 level, is as last reported, and from it we are obtaining good ore for the mill. The No. 2 north 300 stope is opening up as fine a body of ore as ever stoped south, and the quality of the ore is also improving. The east crosscut from south end of main south drift, 300 level, has been advanced 10 ft during the week. The face of crosscut to-day is in quartz. No. 1 north drift, 400 level, has been advanced 12 ft during the week. The face of this drift looks very promising. We are still crosscutting the No. 1 south vein, 400 level. The crosscut was run east 11 ft and has been run west 21 ft. The face of the west crosscut was in quartz to-day. The vein is somewhat broken. The entire 32 ft is in the ledge. The south drift, 400 level, has been extended 14 ft during the week. North drift, same level, has been extended 22 ft during the same time. Both drifts and the stope on this level are looking well. The incline from 500 level has been sunk about 18 ft.

JUPITER.—Supt. Holmes reports May 20th: On the 600 level the west crosscut is in most favorable ground, in which we will make good progress during the coming week. We will continue sinking the main shaft until we reach the 700 level, or water enough to run our boilers. On the 500 level, in south drift No. 3, we continue to follow the ledge, still pitching to the east and north, the drift having a course as at date of last report, nearly due east. The ledge maintains a width of from 12 to 18 inches, all good ore. Average assays of ore extracted during the past week, $60 per ton.

STANDARD CON.—*Free Press*, June 5: The north drift from the east crosscut, 700 level, is in 105 ft, having been extended during the week 55 ft. The north drift, 500 level, is in 12 ft. The south drift has been run 14 ft. The work of timbering the drift on the 385 level is now completed. The north drift on the main ledge, 550 level, has been advanced 13 ft; total length, 186 ft. There is no change to note in the appearance of the different stopes throughout the mine.

BULWER CON.—The south drift on the Stonewall ledge, 280 level, has been extended during the past week 12 ft; total length, 90 ft. The ledge is 2½ ft wide and is looking well. The south drift on the Ralston has been run 14 ft; total length, 210 ft. The ledge is 3 ft wide of milling ore.

SUMMIT.—The north drift, 530 level has been advanced 12 ft; total length, 318 ft. The ledge is 3 ft wide. The south drift is in 249 ft; progress for the week, 11 ft, showing a vein in the face 12 ft wide. The east crosscut from the south drift, 530 level, has been run 12 ft, and is at present in hard rock.

MCCLINTOK.—The three compartment shaft of this mine is now 150 ft below the 300 level, and well timbered. The ground is porphyry, interspersed with iron pyrites and bunches of quartz.

MINING NOTES.—*News*, June 4: At the Addenda they are opening up the station at the 500 level, preparatory to crosscutting. At the Goodshaw they are driving ahead on the 550 level and drifting on the ledge lately cut. At the Champion they are sinking the shaft in hard rock. At the Mono they are driving the joint drift on the Bodie and Mono line and raising and sinking the winze to connect the 400 and 475 levels. At the South Bulwer they are driving the north and south drifts on the ledge recently cut on the 550 level. At the University they are sinking the shaft and opening up the ledges cut on the 500 level. At the Noondays they are setting up the machinery on the 512 level at the incline shaft, and are raising daily about 125 tons of milling ore. At the Booker they are driving the east crosscut rapidly forward in a vein formation of the most favorable character.

NEVADA.

GRAVEL MINE ITEMS.—*Herald*, May 29: Hydraulicing has been commenced at A. J. Turner's claim, situated at Hunt's hill. A clean-up was made at the Sailor Flat hydraulic diggings during the present week, and the result yielded two gold bars valued at $10,000. The Wind-up G. M. Co., at Quaker Hill, commenced tunneling a few days ago. The clean-up at John Noyes claim at Quaker Hill, this week, gave a satisfactory yield.

IDAHO MINE.—Grass Valley *Union*, June 2: The bullion product of the Idaho mine for the month of May was the best for many months, amounting to $44,000. The mine is looking well, and there is a probability of a return, during the season, of the old time monthly dividends, which were $5 per share. The June dividend has not yet been declared, but it is announced that it will be $3 per share. The Idahó promises to continue to hold its place as the great gold-producing mine of the State.

SAPSUCKER MINE.—*Transcript*, June 2: The parties having the contract to run 100 ft of tunnel at the Sapsucker drift mine near Quaker Hill, completed the job last Saturday. It is not determined yet whether work will be resumed immediately on the claim.

GRASS VALLEY ITEMS.—A rich lot of quartz is now being milled from the Ford & McDonald claim on New York hill. Ruhe Thomas is "piping" regularly on his claim on the Grass Valley slide, and expects to have a later run than in any previous season.—*Union*.

FORTUNA MINE.—Grass Valley *Union*, June 5: The now hoisting works of the Fortuna mine have been running for a week or more, the machinery being strong and working well. Good provision has been made for handling water, as a 9-inch pump is used to the present depth of the new shaft, 122 ft, and below that point a 7-inch puump will be used for sinking. The water has been pumped out of the mine, and 3 8-hour shifts are now engaged in sinking the shaft, which will be put down 80 ft, which will make the full depth 200 ft, when a drift will be started. The rock now being taken from the shaft is of good quality, and shows well in sulphurets. The ledge is a strong one, and at the present depth is about 9 ft in width. The shaft is perpendicular to the depth of 122 ft, and will be carried down in the same way, as the ledge, so far, is nearly upright between the walls.

PLACER.

HOLLIS MINE.—Dutch Flat *Forum*, June 3: This mine, at Elmore hill, has been piping regularly for the past month, a clean-up was made last week and the result is said to be very gratifying to the owners. The water was turned off Wednesday for the purpose of moving some of the pipe.

QUARTZ MILL AT HUMBUG.—Some San Francisco parties, who were in town last week, have completed their arrangements and will proceed to erect a quartz mill at Humbug mining camp below Green Valley on the American river. The mill is to be shipped and erected at once.

YUBA QUARTZ MINE.—*Foothill Tidings*, June 5: Work has been resumed on this mine, situated on the South Yuba, just above Washington, under the superintendency of Mr. Geo. Lord, of this place, who is now getting the mill in order; and indeed the mill would now be ready to run but for the unavoidable delay in getting the copper plates. Work in the mine is being pushed ahead and the ledge is said to be looking well.

SOUTH IDAHO.—This mine is said to be in a fair way to development, as a San Francisco company are said to be willing to furnish the necessary capital for sinking the 100 ft deeper, which will make it 175 ft from the surface. The ledge in the shaft is a strong one, being 7 or 8 ft thick, and shows well in heavy sulphurets.

SOUTHMAN'S CREEK.—Report is that very rich gravel has been recently found in this mine, and as water is plentiful and the claim in good order, there seems to be no reason why a most prosperous run should not this year be made.

LOWELL HILL ITEMS.—*Herald*, June 5: T. S. Myrick, now at Lowell Hill, in a letter to a friend here, includes the following items: The snow is gone, excepting large drifts here and there. The ditches are full of water. The Little York Co. are running 4 hydraulic claims, one at Little York, one at Christmas Hill, one at Liberty Hill, and one at Remington Hill. The Steep Hollow, Planet, East New York, Swamp Angel and Golden Bull, which are tunnel claims, are rushed forward by their owners.

PLUMAS.

SUNNYSIDE CO.—*National*, May 29: This company had to shut down work for a short time on account of the scarcity of provisions. The snow was too deep to admit of getting in a new supply.

BUTTERFLY MINES.—These mines are in full blast, and showing up well. They will give a good account of themselves this year.

TUOLUMNE.

NEW ALBANY MINE.—Tuolumne *Independent*, June 5: This is the only mine and works at present in active operation on the North Fork. The present company came into possession of this mine 0 years ago, and have in the meantime constructed one of the best 10-stamp quartz mills in the county and also developed the mine with the most flattering showing for a rich and inexhaustible lode. There is water power, high pressure—something like 300 ft, 2 nozzle and 8-ft hurdy-gurdy wheel. This gives power sufficient to drive a 30-stamp mill. Hoisting works, one and water out of the mine, is also by water power, on the same plan, under pressure of 150 ft. The mine dump is 200 ft from the mill dump. The cars conveying ore to mill are operated by action of gravitation, the loaded car hauling up the empty one. The 800 level, which is tho greatest depth worked, the vein is 8 ft wide, and found to widen out as the works continue downward. In connection with the mine and mill the company own a right to 60 inches of water.

OLSEN MINE.—Jamestown Cor. Tuolumne *Independent*, June 5: Last week I visited Golden City, where the famous Olsen mine is situated. The mine is in operation, with a force of 25 men, at 8-hour shifts. They have the hoisting works over the main shaft completed, with an engine, cage, etc. The shaft is a perpendicular one and down 114 ft. They are not working the main shaft at present, being engaged sinking north and south. The south is down 70 ft, the north 80, and is connected with the main shaft. I believe the company are undecided whether to build their mill down on the river, 4 miles distant, or at the mine; but there being no water at the latter, it will be a drawback to them.

TULARE.

EMPIRE MINE.—Visalia *Delta*, June 4: The hoisting engine for the Empire mine has arrived, and on Thursday was forwarded from Visalia. The tramway of the mine has been repaired, and in a few days will be in good running condition. Snow is all off in the flat, and is fast disappearing from the timber.

ITEM.—Mr. Flemming, late Supt. of the Empire mine, will shortly return to Mineral King for the purpose of prospecting work on his claims near Crystal lake.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Supt.s' Letters, June 5: West drift, 2300 level, extended 30 ft; total length, 158 ft. North drift, 2400 level, 34 ft; total from the incline, 818 ft. East drift, 2400 level, 34 ft; total, 185 ft.

UTAH.—Main incline 108 ft below the 1950 level; ground very hard. On the 1750 level the southeast drift is now out 510 ft; ground soft.

UNION CON.—On the 2300 level the joint Mexican drill hole from the east crosscut has been extended 80 ft. On the 2400 level No. 2 winze has been sunk and timbered 4 ft. The hoisting engine at the top of this winze is now up and ready to be put in operation. On the 2500 level the northwest drift has been extended 11 ft, and is now being timbered up. The south drift has been extended 16 ft. During the week but 45 tons of ore have been extracted from the 2300 level, and as it has not yet been sent to the mill the average assay is not known.

MEXICAN.—On the 1600 level the joint Ophir east crosscut is being repaired. On the 2300 level are enlarging and timbering the north lateral drift. The joint Ophir winze has been sunk and timbered a distance of 14 ft. The joint Union Con. drill hole from the east crosscut has been extended 80 ft. On the 2500 level the joint Ophir upraise has been extended 22 ft, and the north drift bas been extended 41 ft.

OPHIR.—On the 1000 level are repairing and retimbering the north drift and the joint Mexican crosscut. On the 2100 level the drill hole has been extended 70 ft. On the 2300 level tbe jolnt Mexlean winze has been sunk and timbered 14 ft. On the 2500 level the joint Mexican upraise has been extended 22 ft, and the north drift 16 ft.

CALIFORNIA.—During the week there have been extracted and sent to the mills from the 1500, 1050 and 1750 levels, 360 tons of ore of the assay value of $42.78 per ton.

SOUTH VIRGINIA.—On the 2300 level the south drift has been extended 20 ft. During the week there have been extracted and sent to the mills from the 1050 and 1750 levels, 1,503 tons of ore of the assay value of $58.56 per ton.

YELLOW JACKET.—The south drift, 2828 level, towards the Crown Point mine, has been advanced 52 ft during the past week, making the face of same 96 ft from the shaft. The ground is a mixture of quartz and porphyry and very dry.

BELCHER.—Have started work in the face of north drift, 3000 level, which is now in 124 ft from the incline. Work in the face of south drift, same level, will be commenced to-morrow evening. The car track in both the north and south drifts has been repaired, and some necessary repairs have also been made in the north incline.

BEST & BELCHER.—Letter of the 6th says: For the week ending to-day the joint shaft has been sunk and timbered 35 ft; total depth 1,225 ft. Machinory at shaft is in good working condition.

CROWN POINT.—Letter of the 6th says: East drift, 3000 station, now in 141 ft, having made 42 ft during the week.

GOUGH & CURRY.—Letter of the 6th says: During the past week the joint shaft has been suuk and timbered 35 ft; total depth to date 1,225 ft.

SUTRO TUNNEL.—Report of progress in the north lateral braneh for the week ending June 1st: Number of ft driveu at last report, 3,043; number of ft driven since, 106; total number of ft in branch, 3,140. Report of progress in the south lateral hranch: Number of ft driven at last report, 1,013; numhor of ft driven since, 148; total number of ft in hranch, 1,101. During the month of May the north lateral drift was advanced 321 ft; south hranch 315 ft. In the south branch considerable timbering has heen necessary.

AURORA DISTRICT.

REAL DEL MONTE.—Esmeralda *Herald*, June 5: Tbe main shaft has now a depth of 560 ft, and is being pushed vigorously.

THANKSGIVING MINE.—This mine, recently sold to Eastern capitalists, has resumed work under the new management. A mill site has been purchased and a mill will be erected shortly.

EUREKA DISTRICT.

EUREKA CON.—*Aetna*, June 5: Work on the new 3-compartment shaft of the Eureka Con. is being pushed vigorously. Three 8-hour shifts of picked men have been put on. The shaft is now down 63 ft.

RICHMOND.—Early in the week a cave was struck in the drift running from the 200 level of the Richmond. It is 80 ft long, 40 ft high and 40 ft wide, with ore under and above, but of what grade we have been unable to learn. Another cave, 196 ft long, 30 ft wide and 20 ft high, was discovered in the mine on Friday, in a drift going from No. 14 chamber. There is ore in it and some splendid specimens of crystallized lime. Eleven contracts were let in this mine on the 1st.

MARY ANN.—This mine is on the western slope of Prospect mountain, on the north line of Prospect Mountain tunnel, and shows very rich croppings on the surface. We have seen some specimens of rich chloride taken from the bottom of a new shaft 10 ft from the surface which assays $150.

HOOSAC.—Work on the Hoosac has been suspended until air pipes can be secured and placed in the mine, the ventilation being so bad as to render further progress almost impossible. A body of clay 10 ft thick was passed just before stopping, and quartz encountered beyond it. The stockholders are sanguine that the Hoosac will again become a large bullion-producing mine.

MINING NOTES.—A seam of ore assaying $500 has been exposed on the surface of the Silver Stato mine, on McCoy hill, and can be traced for over 200 ft. A quautity of high-grade ore is on the dump of the Original Baltie awa ting shipment. Recent assays from this mine have run as high as $345.

ALTONA.—Robert Young and partners have struck a bonanza in the Altona, and have made several shipments to the Eureka Con. reduction works this week. The breast of ore is 20 ft wide, and works $104.74 and $30.92 in silver, and $67.32 in gold.

IDAHO CON.—The 2-compartment shaft on the Idaho Con. is down 180 ft, the bottom of the shaft being in very favorable ground. The shaft will be sunk to a depth of 200 ft, when connection will be made with the ore body found at the end of the main incline.

ITEMS.—The lessees of the Macon City have 50 tons of ore sacked up ready for shipment. The ore found in the Paul Pry a week ago has opened out to a width of 3 ft. A very favorable change took place in the face of Eureka tunnel on Monday night, and the contractors are making good headway. The tunnel is now in over 1,300 ft. Peter Peterson is shipping ore from the Good Hope, on Adams hill.

NEWARK DISTRICT.

MINING NOTES.—Some 20 men are at work in the Bay State mine. Within the past 3 months this mine has produced $86,000, and they have a fine body of ore on the 75 level. At the Battery mine, owned by R. Sadler, 9 men are at work, and they have struck a vein of ore 2 ft thick, which gives promise of a large ore body opening out. Mr. A. Dewitt is doing assessment work on the Dewitt tunnel and Uncle Sam mine.

PHILADELPHIA DISTRICT.

BELMONT MINE.—*Courier*, May 29: From superintendent's letter of the 27th: All parts of the mine now being prospected show a marked improvement since last writing you. Our drift started north from the upraise 100 ft north of shaft, between 200 and 300 levels, is showing 8 to 12 inches fine milling ore, and as there is a block of unprospected ground between these levels, about 150 ft in length by 100 ft in depth, I do believe we will open up a fine body of ore.

OTHER MINES.—We understand that one or two companies owning mines in Philadelphia district are making arrangements to start up work again shortly. There are good mines in this district that would pay well if the owners worked them properly.

REESE RIVER DISTRICT.

MANHATTAN M. CO.—Letter of the 4th: For the week ending this morning, the mill has reduced 121 tons, 1,010 lbs of ore, assay value of $27,610.59. Of this amount $6,124.94 was from custom ore; $8,043.33 from tribute ores; and $13,442.32 from the Curtis shaft. During the month of May the mill reduced 541 tons of the assay value of $131,070.91. Of this amount, $27,534.85 was from custom ores; $12,663.10 from tribute ores; $82,021.33 from the Curtis shaft; and $7,900.54 from the Frost shaft.

SILVER CANYON DISTRICT.

SADIE L MINE.—Ward *Reflex*, May 29: We learn from parties just from Silver Canyon that the Sadie L has been sunk on 100 ft, and a vein 20 ft in width has been exposed. About 12 ft of the vein, it is thought, will go $150 to the ton. Assays going as high as $2,000 have been obtained from this portion of the vein. The mine, we understand, has been bonded to Eastern people for $18,000. Assessment work is being done on a number of claims in the district. The southern extension of the Sadie L carries in the main chloride ores of a high grade wherever it has been touched. No attempt has yet been made to sink upon it.

BUCKHORN.—This claim crops out boldly 3 or 4 ft above the surface, and [assays from the croppings go $400 and over. This ledge was not worked last winter on account of the deepsnow. The ores are free milling, and it will not be difficult to work them up to 90%. A mill will be put up this summer, and the real worth of the mines of Silver Canyon will then be more practically demonstrated.

SPANISH BELT DISTRICT.

BARCELONA.—The ore in the north drift continues of the samo rich character as the work progresses. This company could now keep a 20-stamp mill running steadily on ore from their mine. Spanish Belt district will be the scene of much activity this coming summer.

WHITE PINE DISTRICT.

WARD BEECHER, ETC.—*News*, June 3: On Monday last Mr. W. B. Bourne, of tbe Ward Beecher Con. mino, on Treasure hill, accompanied by Col. Joseph Fulton, of San Francisco, and Mr. M. Provine, of Grass Valley, Cal., arrived, and have since been engaged in examining the Ward Beecher, Hidden Treasure and Mammoth mines, all of which are principally owned by Mr. B. Work will be resumed on the Ward Beecher to-day, under the superintendence of Col. F. Two shifts of men will be employed sinking the shaft, and the mine will be thoroughly opened. It is kuown that there is a large body of good milling ore in the Ward Beeeher, which will pay to work. Mr. P. is an experienced mill man, and will remain here to put the Manhattan and Big Smokey mills in good working order, and take entire charge of them. These latter are also the property of the company. Col. F. will superintend the mines. We are glad to see work resumed on the Ward Beecher, and hope that the Hidden Treasure will also be started up soon. The Mammoth mine is said to contain, already exposed, a vast amount of $30 and $35 ore, which, we understand, Mr. P. believes will pay to mill.

EBERHARDT & AURORA.—Work is being steadily prosecuted on the prospecting drift in the Eberhardt & Aurora tunnel, and the prospects are more than favorable.

WILLOW CREEK DISTRICT.

PAYMASTER MINE.—Cor. Eureka *Sentinel*, June 1: A note from Willow Creek informs us that tbe new mining discovery recently made at that place, and heretofore alluded to in these columns, is named the Paymaster. The locators are H. H. McColly, Mr. Street, Wm. Reardon, James Edwards and J. H. McAllister. The ledge is about 10 ft wide and the ore resembles that of the Ohio mine in the same district.

ARIZONA.

TOMBSTONE DISTRICT.—*Epitaph*, May 29: Work on the Head Center mine goes on steadily and with floe results. The main shaft is 265 ft deep, and is sinking at the rate of 2 ft daily. On the 132 level a crosscut has been run 50 ft, all in vein matter, over 30 ft being in good ore. On this same level a drift has been run 57 ft south. On the 210 level the south drift is in 100 ft. Ore from this mine carries a great deal of free gold, and some beautiful specimens of this character of rock have been taken out. Chlorides are found in abundance and give high assays. The results so far show a yield of about ¼ gold.

GRAND CENTRAL.—The new wire rope has arrived, and the second reel of the hoister was set in operation, and both are running constantly. Already the main shaft is down 240 ft, where a station will be made for the 4th level. On the south end of the claim, 1,200 ft from the main shaft, is the new prospect shaft which, at the time of our last report, was down 40 ft with a 40-ft drift following the vein north toward the main shaft. This drift is now in 147 ft, following a vein of very handsome ore the entire distance, which averages 2 ft in width. About 100 tons of this high-grade ore are already on the dump.

GLOBE DISTRICT.—*Silver Belt*, May 29: Mr. Keeler has shown us a most beautiful collection of ore from the Shakespeare and Quaker mines, owned by Keeler, Read and others. The Quaker is 10 ft wide, showing at the depth of 10 ft, where the vein is cut, a pay streak of from 5 to 0 ft, carrying both gold and silver, which, collectively, averages about $70 per ton. The Shakespeare is also a large vein, showing an average cropping from 3 to 8 ft wide.

MINING ITEMS.—The news from the Silver Nugget is very encouraging, the rich ore bodies growing in width as depth is attained. Also the Mack Morris is retaining its good name for richness and quantity of ore.

LOST GULCH.—This gulch is destined to become the center of gold mining operations, not a week passes but that propertica located in that belt change hands.

SANTA RITAS DISTRICT.—Tucson *Citizen*, May 31: Mr. Samuel Katzenstein, who arrived in town on Saturday, gives a fine report of mining matters in this district. He says the whole country for 5 to 10 miles around is full of mineral, and the rock is of a very high grade.

SHAMROCK MINE.—Mr. Katzenstein has sunk on the vein of the Shamrock to the depth of 40 ft, and it is believed that the rock, which is a carbonate and Chloride ore, will work up to $60 or $65 per ton.

QUEBEC AND YUBA.—The Quebec mine, owned by P. M. Hilton, shipped 2 tons of tbe ore to San Francisco for milling. Mr. H. shipped 2 tons of ore from snother of his claims, the Yuba, and was rewarded by the handsome return of $478.06 per ton. On this claim he has sunk about 10 ft, and has a vein about 18 inches wide. He will continue the shipment of ore to San Francisco until the custom mill at Charleston comiences work.

COLORADO.

GOLD AT LEADVILLE.—Denver *Tribune*, June 2: In a recent interview with the editor of the *Circular* on "Leadville as a Gold Camp," Manager Daly said: We have had a partial clesu-up in the Colorado Prince, and I thiuk I can see that we can get out, at a cost of about $7 for mining and milling, about 30 tons of ore per day, which will be worth about $20 per ton. I find that all through Breece hill, from the Evans to California gulch, the rock underlying the iron carbonate deposit is quartzite, seamed with fissures, most of which carries gold in large quantities. This is plainly shown in the south end of the Colorado Prince, in the Miner Boy, on the Black Prince, and in the Great Hope, on the north bench of Breece hill. It is my opiniou that all mines on this belt will, at a sufficient depth, enter the same gold-bearing formation.

LARGE ORE SHIPMENT.—The largest ore shipment ever made by a Leadville company in a single day was by the Little Chief, on Sunday last. It has been stated as 270 tons, but the official figures from the Grant smelting company show it to have been 281 toos, 440 lbs.

CENTRAL CITY ITEMS.—*Register-Call*, June 4: Col. P. R. Smith has purchased the stamps, batteries, shafting, etc., formerly used in the Hardesty mine in Nevada, and will erect a 25-stamp mill, as also concentration in North Clear creek immediately below the Dallas mine. Mr. Wain, of the Empire mill, in Black Hawk, crushed a lot of mill ore from No. 11, Gregory lode, property of the Naragansett Co., which yielded 6 ounces gold per cord. An assay of ore from the Robert E. Lee mine on Hamlin mountain, made by Prof. Goodale of the Boston & Colorado smelting works, gave a showing of 359 ounces silver per ton.

IDAHO.

SHAW'S MOUNTAIN.—Boise City *Statesman*, June 3: From Mr. A. L. Rucarson, who was over on Shaw's mountain mines last Tuesday, we learn that the Plowman mill is now running and crushing about 18 tons per 24 hours. There are about 130 tons of ore at the mill ready for crushing. Besides this there is a large amount of ore on the dumps at the mines ready to be hauled to the mill as soon as the roads will permit. There is certain promiso of abundant water this season to run the mill, and from present indications there will be no lack of ore from the mines.

YANKEE FORK.—*Herald*, May 29: Developments are prosecuted on the Unknown with very flattering results. In the present workings the vein is 20 ft wide, of excellent milling ore.

LUCKY BOY.—The shaft on this mine is now 69 ft deep. So far as opened the vein is very solid, and during the past month 20 tons of ore, the assay value of which is from $450 to $500, have been taken out. The shaft is going down at the rate of 6 ft a week. About 180 ft west from this point another shaft 5x8 ft was started down on the hanging wall.

NEW MEXICO.

GRANITE GAP DISTRICT.—Cor. *Grant County Herald*, May 29: This newly-formed mining district adjoins the San Simon. The Granite Gap mine has a shaft 50 ft deep, out of which 18 tons of ore have been taken, yielding by assay at the rate of 16 ounces per ton. The ledge is from 3 to 6 ft wide. Indian troubles have stopped work.

WHITE OAKS MINES.—Las Vegas *Gazette*, May 29: Yesterday was received the first shipment of bullion from the White Oaks mines. It consisted of $600, the result of the clean-up of an arastra run on Homestake ore. There was but 1,500 lbs of ore put into the arastra, and $600 was the result. The arastra was hastily and imperfectly constructed, and a good portion of the rock was not ground up at all, but resnlt is ample and sufficiently satisfactory.

UTAH.

MINING PROSPECTS AT OGDEN.—Cor. Salt Lake *Tribune* May 28: While very light prospecting has been done by many individuals, none or but little vigurous work has been commenced until very recently. Two companies are putting arastras to work, and will within the next few days have them in operation upon ores that at the surface give good returns. Each of these companies has a roaster also. Ore is being taken out of other claims preparatory to shipping to smelters for reduction, that the full value of the claims may be fully computed. The want of capital has caused good claims to lie dormant. Judge Brewster lately organized the Ogden C. D. C. with a capital stock of $1,000,000 in shares of $10 each. James C. Thomas is Pres. and John H. Avery Sec'y and Tres., and Chicago, Illinois, is the headquarters of the company. Eight claims of 600x1,500 are owned by the company, and the property lies between Taylor and Waterfall canyons, and within three miles of the depots of Ogden City.

ALTA DISTRICT NOTES.—*Daily Tribune*, May 27: The Madelon has 12 men running a tunnel and sinking a shaft. Tho Emma, leased by a hand of six, is taking out some rich ore. Litigation over this famous property has started out afresh. The Vallejo has a force of about 15 men. They are engaged in driving a tunnel and shipments are suspended for the present. The Bay City, or, as it is now known, the American Emma, is worked by a force of six men. They will he helped by an additional force as soon as the machiuery is placed.

Protection of Plants Useful to Man.

[By W. N. Lockington.]

Plant life, like animal life, has to struggle for existence. The young plent may bs choked by other species, or crowded out by rivals of its own kind, even though the atmosphere, soil and position are wsll suited to its growth.

Men sows the seads and gathers the crops of such plants as he desires, yet he has hitherto failed to protect them adequatsly, especially in ths pastures upon which he chiefly depends for the food of his domestic cattle, against rival aggressive species of plants. If, in this respect, hs has not done all that he could do, he hes still more signally feiled to protsct his crops against the attack of destructive animals, more especially of insects. That he cen do much towerd this end, if he uses his intslligence intelligently, will, I think, be evident after a little consideration, which, with both plents and animals, may be divided into—

1. Protsction against man's waste and wanton dsstruction.
2. Protection during the season of reproduction.
3. Protection against rival plents.
4. Protection against animal enemies.

First—The forest areas are gradually diminishing throughout the world, and man is, in most cases, the direct cause of ths diminution. A country without trees is arid, unfit for men's hebitation. Man's own acts have thus rendered nninbabitable vast tracts that once were celshrated for their fertility.

In the words of F. L. Oswald, M. D. ("Popular Sciencs Monthly", August, 1877): "Since the advent of the Christian religion, the physical history of our planet records the steedy growth of a dessrt, which mads its first appearence on the dry tahle land of southern Syria, and gradually spreading eastward down the Euphrates toward Afghanistan and westward along hoth shores of the Mediterranean, now extsnds from eastern Persia to the western extremity of Portugal, and sends its harbingers into sonthern France and the southeastern provinces of European Russia. Like a virulent cancer, the azoic sand-drifts of the Moab desert heve eaten their way into southern Europe and northern Africa, and dried up the life springs of districts which, hsyond all dispute, wers once the garden regions of this eerth.

"The Mediterransan ssa, once a forest lake of paredise, is now a Deed sea, surrounded by dusty and burning coasts, often for hundreds of miles without a vestige of organic life."

Ths highlands of Persia and Parthia, once the homss of conquering races who preceded Rome in empire, and successfully repelled her armies, ere now the homes of famine and misery. The once fertile plains of Mesopotamie and Chaldæa ars en alluvial desert; Asia Minor, itself once the seat of powerful empires, a tresless rgion of rocks and ruins; north Africa, the granery of Rome, a sterile dessrt; and even southern Italy, Greecs and Spain only retain a shadow of their former hsauty or of their formsr population. Ths prsponderances of population of Italy and Spain has been transferred to the northern portion of those countries, and Greeks exist chiefly by virtue of their commercial and maritime tendencies.

Champollion, who traced the course of former rivers and brooks, and found tree-stumps upon the plateau of Sidi-Belbez, in the center of the Sahara, exclaims: "This dessrt may oncs have been a region of groves and fountains, and the ahode of happy millions. Is there any crims against Nature which draws down a more terrible curss than that of stripping our Mother Earth of her sylvan covsring? *** Earth was Eden once, and our missry is the punishment of our sins against the world of plants. The burning sun of ths desert is the angsl with the flaming sword who stands between us and paradiss."

Evsn mors northsrn countries ars not innocsnt of tree-slaughter. "Cut down ths trees; every tree shadee enough ground to grow so much wheat," was the doctrine of agricultural writers in England a few yeare ago, and the pernicious advice was largely followed hy the cutting down of hedges, hedge-row trees, and coppices. Southern England has long been denuded, but has now heen partially replanted. The actual need of timber prompted action.

In many parts of the United States, recent as is its settlement, clearing has proceeded too far. The central portions of Ohio, parts of Kentucky and Michigan, and, to a still greater extent, the cotton growing States of Missiesippi, Alabama, Georgia and South Carolina, are becoming arid, and drouths are frequent.

Is it not time, then, to stay the destroying hand, and to foster what we have destroyed? How long will it be before the redwood forests of the coast range of California cease to exiet, and the curse of fallenness fall on the fertile valleys of the coast range?

Let man, in all regions where the forest areas are not eo large as to prevent settlement, leave all the trees above the cultivable line upon the hillsides, and patches in the valleys, hesidee those about watsr-courses, eprings, and huildings. Let him plant the already denuded regions, and henceforth, before he cnt down a tree, let him consider well whether it can he epared, remembsring that what he can cut down in a few hours takes perhaps hundreds of years to grow.

While trees muet be cut down for timber, it is a shame to cut down for firewood any good tree that can he spared. Lopped off limbs, trees that are too crowded, or are deformed, and the hranches of trees cut down for other purposes, should he our sources of firewood.

As man increases in numhers, and as the higher races sattle in the neighhorhood of the immense forest regions of Equetorial America, Asia and Africa, some tree-slaughter must take place to make room for agriculture. If this is done in the same indiscriminate way that has heen followed in the earlier homes of thsss races, not only will many interesting species become extinct, but many trees which yield valuahle gums, resins, fihers, timber, and nuts and fruit, will become scarce or even extinct before their cultivation has extended sufficiently to compensate for the absencs of the uncultivated plants.

Unless some check is put by the growth of reason, enforced npon the unreasoning in the form of a law they must obey, the reign of sterility will ultimately be extended even over the wide-watered lowlands of the Amazons, and the whole earth will he by men's hands converted into a vast Sahara. Nor is waste confined to the "clearing" process. Trees are felled for timher that might with advantage be left to grow, and are killed to procure their resinous or other products, when tapping would answer the purpose as well. These are criminal acts; they ars in direct contravention of Nature's laws, and shonld bs equally so of human laws. In pursuancs of their own selfish ends, individuals thus enrich themselves at the expense of a community which as yet is not sufficiently alive to its interests to visit the crime with fine or imprisonment.

Sscond—Men protects the food-plants that are under his immediate care during the season in which they mature thsir seed; he gathers thoss seeds end preserves a portion for future crops. Tbere are many cases in which he would do well to extend his care to ussful plants and trees which, though like fishes among animals, they ars undomesticated, yet supply him with food or materials of soms kind. Meny a valuahls tree or plant, now comparatively scarcs, might bs rendered abundant by the careful preservation of the fruit whenever accessible to men; and by the transplentation of young trees and saplings from locetions where they are certain to be crowded out by the oldar plants around, to places where thsy cen be sure of light and air and space in which to grow. In this way, without actual cultivation within enclosed fields, man can bring his powsr to the assistance of Nature, to the end that he may still continue to maintain his plac in Nature.

Third—Man takes care of his cereals and rootplants, preserving their seed, prsparing the ground for them, and to a great extent destroying the rival plants that encroech upon their domain. But in pasture lands, whether such are sown by man, or untouched by the plow, hs to a great extent leaves ths useful plants to struggle for existencs as best they can.

In the meadows and uplands of such an old settled country as England some care is taken; but in newly settled countries like ours the agricultural population allows "weeds" of various kinds to extend themselves over the fields, and then wonders where they came from.

If the fight were fair and all things left as they were before ths advent of civilized man, the useful species might, in many instances, prevail; but in fields cropped hy sheep, cattls or horses the fight is not fair. The grassss and edihle plants are eaten off close, and have no chance to mature their seed, while evsry dock, thistle, nettle, ranuuculus or other inedibls or poisonous plant safely grows and, undisturhedly, ripens and sheds its seeds. Who then, possessed of common sense, need wonder at the prevalence throughout this new country of such introduced weeds as the stinking mayweed (*Maruta cotula*), the spurvey (*Spergula arvensis*), the Spanish thistle (*Centaurea solstitialis*), ths blessed thistle (*Silybum marianum*), the wild mustard (*Brassica nigra*), or many others. Who, under such circumstances, need wonder than in autumn the fields of California are a mass of compositæ, mostly untouched hy animals—a mase among which the various species of "tarweeds" (*Madlia sativa* and others) are most conspicuous.

The myriad seeds of these weeds cannot be confined to the pasturee. They invade grain fields and gardens, vineyarde and orchards, and, backed by the vast reserve country over which their reign is estabiished, often successfully hid defiance to the farmer by flourishing amid his most precious crops and under his windows.

The only remedy is intelligent industry, and the misfortune of man's social habits is, in this as in other matters, that any industrioue man must euffer somewhat if his neighbors are idle. He may mow down his thistles, mayweed, tarweed, mallow, etc., before they can seed, but unlese his neighbore do the like, he must he on the watch againet a perpetual invasion.

The disappearance of many native plants before the inroade of others, hrought by colonists, has been remarked wherever the European has settled. He hrings his cereals, and with them cannot avoid bringing the seeds of the common wild plants of Europe.

These have already been through the ordeal of adaptation, and have conquered. They are the victors of a long strife which has resulted in the total extinction of some wild species, and the banishment of others to out-of-the-way cornere. They have held their own against man in hie own domain, and some have even learned to grow on the patbs he treads.

In a new country, in competition with a hitherto undisturbed flora, with plants that have for ages sattled ths balance of power among themselves, the emigrant plants, like the emigrant people, have it all their own way, especially at first; hut just as in time a remnant of a nativs race of men recovers itself, fits itself to the new conditions, and again becomes prominent—as ths Indian has in Mexico, Chile and Peru—so is it with some among the invaded plants.

It is noticeahle that in Celifornia most of the native plants that hold their own, or increase and become pssts to man, are of the composite order. The compositæ are the most specialized of plants, and, so far from being created for man's use, are evidently adapted to live in spits of him. Few of them are of any use to him; few furnish food to his domesticated animals. Thus they remain uneaten, and scatter hroadcast seeds which—each enclosed in a separate seed vessel and separately stuck upon a recsptacle—are sure of a considerahly wide dispersion, and which, moreover, are in many cases provided with a downy crown or pappus, hy the aid of which they are horne by the hreeze afar from ths parsnt plant.

But man's efforts towards the destruction, or at least diminution in numbers, of hurtful plants, must not he limited to his fields. If the world is to be really turned to his use, he must commence at once to cleer away undergrowth from his timber trees, and to judiciously thin out ths crowded trees in his plantations. There are many feral species which, though they do not injure his crops, injure useful trees, and against the too great prevalence of these man will ultimately have to teke preventive measures.

Hitherto only flowering plents have been spoken of as enemies to other plants; but thers is a tribs of vegetahls organisms whose raveges are more secrst and more difficult to dsal with, viz., ths fungi. The higher fungi might bs made to furnish much additional good food to man, but the lower arc his deadly enemies. Under such names as smut, bunt, rust, ergot, they attack our cereals; as hlack moulds they destroy foliage; as hlue monlds they feed on bread, cheese, preserves, fruits, etc. Nothing is safe from them. The air swarms with their spores, waiting only for a suitable combination of temperature, moisture and habitat to burst into fungoid life. The spores of a singls fungus may run into the billions. If thsy all were to fructify, the world would at oncs he covered with fungi, and ell things else would dis. But fungi can only live in a suitable nidus, and eacb species attacks some particuler plant or animal, or a certain series of plents or animels, and lives on no other. A very large proportion of ths spores remain unfertilized, for the arrangements for fertilization are uncertain. Besides this a peculier blending of heat and moisture is required for the development of fungoid spores, even when the pehulum they require is plsntiful.

Thanks to these limitations, fungi have not yet dsstroyed the higher orgsnisms; or rather, nature has provided the fungi with an almost incalculehle fecundity that they may continue to exist under such conditions.

At present man can do but little against tbese subtle enemies. A field of wheat may be ruined in one night with rust; in a few hours the labor of months may go. The potato-rot is a fungus, so is the grape-mildew, and so are all these mildsws and hlights which still are deemed by many mysterious dispensations of providence.

Stamping ont by ths thorough destruction of the plants they have attacked, is ths surest cure known, it is costly, but less so than the unchecked spread of the fungus. Various chemical suhstances have also becn tried with variable success; but, as said before, man has yet much to learn before he can greatly keep down the numbers of the microscopic germs of such fungi as feed on living plants.

Fourth—The present geological period is often styled "the age of man," and ths tertiary period "the age of mammals"—to distinguish them from the preceding psriods in ths strata of which reptilss and fishes ars ths predominating forms.

But, though the mammalia as a class dominate over all the other vertehrata, both on the land and in the ocean, and though man, to a considerahle extent, dominates over the other mammals, it cannot yet be said that either man or any of the lower vertehrata have acquired full dominion over certain forms of the invertebrata.

Parasitic forms of the most varied structure dwell within, or live at the expense of, the higher animals. Tape worms, round worms, thread worms, flukes, torture the lives of heast and bird, reptile and fish; nor do they spare the invertebrata. Crustacea, of low degree, inhabit all accessible outside and inside parts of marine animals, and on the land insects are even more aggressive in their attempts on plants and animals. Indeed so abundant, eo omnipresent, is insect life on the land and in the air, so countless are insect forms, and so wonderful the metamorphosee which they pase through, and the adaptations by which they gain access to their victims, that the present period may fairly be called the age of insects. Even man is not exempt from the attacks of many, while his lordly frame furnishes food to others. These direct enemies are sufficiently annoying, but they are as nothing to the indirect ones which attack the plante he uses for food.

Beetle and moth-larvæ in growing trees, eating them into dust and riddling them with tortuous gallerice; "grubs," chiefly of beetles, but often of other orders, in fruits and nuts and seeds; gall insects on leaves and twigs—all these pursus slowly, unohtrusively, relentlessly their work of destruction, hiddeu from the sight of man until the evil is done. The foliage of man's cherished gardsn trses, of his fruit trees and choica exotics, and worse still, of the crops upon which he depends for sustenancs, is destroyed before his eyes by a countless host of caterpillars which he is powerless to kill. The scale-insects (*Coccidæ*) and "smother flies," or aphides, cover the stems, leaves and flowers, aliks of his roses and of his cauliflowers, his green-house darlings and his kitchen herbs.

In his endeavors to destroy thess pssts he is often worsted; at other times conquers only by the sacrifice of his crops or trees, lest the plague should spread. Tiny acarids, as the phylloxera, atteck his vines, and ths vintege is lost. Bsfore thess enemies he has too often stood helpless—helpless through ignorance.

But so great have been insect ravages, so widespread the misery wrought by them, that, in a few instances, governments have employed investigators to search a cure. The phylloxera in Francs, the grasshopper in the United States, forced recognition of their importance as chacks upon humen lifs, and commissions were appointed, which have already done great servics.

By a study of ths life history of eech hurtful spscies, it is usually found that there ars other species which feed upon it, end which should, therefore, be encouraged. Also, that at some period in their lives they can be more readily destroyed than at others; or tbat diffsrent methods of destruction are most efficient at different periods of their lives.

Some idea of ths methods to he pursued may bs ohtained by the enumeration of thoss recommended for ths destruction of ths Rocky Mountain locust by Messrs. Riley, Packard and Thomas in their report for the year 1877.

These methods may be divided into (1) encouragsment of natural agencies, (2) dsstruction of the eggs, (3) destruction of young or unfledged insscts, (4) destruction of the mature or winged insects, (5) preventive measures.

The first is ensured hy, as far as is possihls, assisting the multiplication of the various insect ensmies of the locust, such as the *Anthomyia* fly, which lays its eggs within ths locust eggs; the flesh fly, which does the same; various ground beetles, blister-beetles and soldier-beetles, which usually, while in the larva stegs, eat the locust sggs; the locust mits (*Trombidium locustarum*), which destroys hoth eggs and adults, fastening itself under the wings of the latter and sucking them dry; various *Carabidæ* and *Cicindelidæ* among beetles, and *Asilus* and *Tachina* among flies, all of which prey upon the edult locust, and also by fostering such birds as prey upon them. Bleckhirds, robins, prairie-chicken, quail, lerks, poultry, turkeys and crows all aid in the work of destruction, and should bs fostered hy man for the purpose in infested districts.

Harrowing in the autumn, plowing under and irrigation are mentioned as methods of destroying the eggs. Ths larvæ can bs killed by burning the grass, by mechines carrying an open-grate with a fire of pitch-pins, covered hy a metal-sheet to force the heat downward; by locust-crushers of various descriptions; hy trapping in nets, pits with winged fences, digging and trenching; by coal-oil and coal-tar, which act as a poison, the former being the more ussful; and hy catching and bagging in machines of various kinds.

In Missouri and Minnesota bounties are paid for destruction of grasshopper eggs and young. In Kansas and Nebraska a certain amount of forced labor is enjoined. The breeding-grounds are known, and on them the fight cau bs most advantageously carried on, but something can hs done even against the winged swarms, by the simultaneous combustion of largs quantities of straw and other matters, producing clouds of smoke.

When the whole courss of life of the dsstroysrs of apple and plum, and pea and bean, of wheat, cotton, maize, and every other product man considers his own, is known to those who cultivate the soil, thers is no question that their ravages can be greatly reduced.

In the dcstruction of insects, birde play the most important part, but some, unfortunately, are themselves vegetable-feeders, while others subsist on a mixed diet. Man has too often, indiscriminately, slaughtered his avian friends in mistake for enemies. The truth is that the great majority of birds do man far more good hy their destruction of insect life than mischief hy devonring his crops, although there are occasions when the latter need protection from them.

The English sparrow—a finch, and, therefore, principally a seed-eater—wae an unfortunate introduction to the United States.

Whcn it is remembered that the chinch-bug in one year caused a money loss of $73,000,000 in Illinois; that the annual loss from the cotton-worm is from $25,000,000 to $50,000,000; and that in 1874 the Rocky Mountain locust caused a loss of nearly $50,000,000, it hecomes evident that the suppression of these insects is equivalent to a great expansion of production, and, therefore, of human life.

Among the domesticated animals are some which, brought from the desert, and accustomed to live upon the few dry herhs of an arid region, have made a desert of the lands where they have been introduced. Such are the camel and the goat—browsers by nature—killing young trees in prefereuce to eating grass, and thus doing incalculable mischief.

The sheep, except in localities covered with

chaparral, is far preferable to the goat; and it is devoutly to be hoped that the range of the camel will never be extended, and that its threatened introduction in California will not take place.

European Influence on American Currency.

One of the strangest spectacles of modern times is that of a great country, known throughout the civilized world by the products of her skill and industry and the aggressive and tireless enterprise of her inhabitants—a country that has made her influence felt in every trade-center of the world, and can control the prices of production everywhere—meekly asking every morning of the money loaners of a city 3,000 miles away, and on the other side of the ocean, what her own coins are worth, the ore for which was dug out of her own mines, and stamped with the seal and pledge of her government.

Here is a country with inexhaustible stores of precious metals, easily mined, that are needed to develop the untouched resources of its broad prairies and teeming forests, practically locking up its vast treasures, and allowing its broad expanse of territory to lie unimproved, for no object in the world but the benefit of the money lenders in Europe and their agents here. Many papers are in the habit of quoting the price of silver in London, with the remark that this makes our dollars worth 87 or 97, or some other number of cents. Our country is in a position to-day to state, and her people to demand, the fact that here an American dollar is worth a dollar, whether the price of silver among the brokers of London be more or less. The best interest of our country imperatively demands that the money it may need should come out of our mines instead of the coffers of the money lenders of Europe. The interest that we have paid them would have peopled our territories, built railroads and schoolhouses, and covered our wildernesses and plains with cities and towns and manufactories, and made us the producing nation of the world. The future greatness of our people and nation depends largely upon the wisdom of its legislators and financiers in regard to the great question of mining. The bleeding artery of interest money that enriches the old country so that they are fattened as upon blood, and impoverishes us, can be closed by a proper encouragement of our mining industries. Our own mines can supply us with all the money that the industries of the country require. The mineral deposits already discovered are sufficient to guarantee a supply of precious metal for more than one generation, and we have as yet by no means begun to comprehend the extent of our mineral resources. The individual or nation is most unwise and foolish that borrows money and pays interest when they have in their possession resources that would bring the money and save the interest. The spectacle is presented to the world to-day of a great nation locking up her own treasures of gold and silver and precious metals, and paying interest for the gold.

Our people are patient and long-suffering, but we shall be surprised if there is not soon sent a petition that must be heard from the mining interest, against the injustice of a legislation, or want of legislation, that is doing it a positive injury. When that voice comes it will demand attention and action, for mining has almost in a day become an interest vast and important.—*Chicago Mining Review.*

The Dangers of Tunnel Driving.—The disease and mortality among the laborers in the St. Gothard tunnel has been excessive. The distance between the entrance to the tunnel and the places where the perforatore were at work, which was nearly five miles on the north side, coupled with the frequent freezing of the compressers, rendered ventilation extremely difficult; and the air was further fouled by frequent explosions of dynamite, the smoke of some 500 oil lamps, and the exhalations of 400 men and horses, working in a temperature of 80° to 95°. The horses, although working only eight hours in the twenty-four, died at the rate of 25% per month, often dropping down suddenly in their tracks, as though shot dead. The men died in large numbers of a disease called tunnel trichinoses, from the presence of an entozoon in the intestines. Three or four months' labor in the tunnel brought on the disease, and twelve months generally made the laborer a confirmed invalid, even if he survived. The symptoms were yellowness of skin, features drawn, eyes half closed, lips discolored, skin humid and gait difficult. Even when the food was taken with appetite it would not digest, and wine was invariably rejected. The Italian doctors pronounced the tunnel "a veritable hell."—*Engineering and Mining Journal.*

Mining Prospects in Idaho.—This year, says the *Idaho Statesman*, promises to be unequaled in the history of stampedes. Residents of the country have long been familiar with the extent and importance of her placer mines. Fabulously rich ores have been encountered in different localities in Ada, Alturas, Owyee, Washington and Lemhi counties, and their extraction and reduction cannot long be deferred. Here in the heart of the Territory, surrounded on all sides by grazing and farming lands, are 20,000 square miles of mineral country, the treasures of which await only an influx of prospectors and capitalists to be made available to the nation.

Useful Information.

Signaling Instruction.

Many of our readers no doubt have often seen United States officers, surveyors and others signaling or talking together at a distance by the waving of small flags. Telegraphs and telephones are well enough in their place, as when we wish to converse often over any given place; but on shipboard, or in the field, at a distance from those conveniences, we need some other device. No sailor ignorant of the ordinary signal code should be allowed to go to sea in any capacity of command. Signaling should be taught in all our schools. We give below, for the benefit and instruction of the curious, the alphabet and system in use by the U. S. army, which is claimed to be superior to any other.

The second columns are the equivalents for which the corresponding letters may serve as contractions. With four of any two kinds of things, fixed signaling can be done. Calling one's right side one, and his left side two, he can transmit any message by waving a handkerchief according to the following table:

Letters.	Word Equivalent.	Signal Number.	Letters.	Word Equivalent.	Signal Number.
A	after	22	P	put	1212
B	before	2112	Q R S	quiet	1211
C	can	121	T	are	211
D	did	222	U	station	212
E	of the	12	V	the	2
F	for the	2221	W	you	112
G	ground	2211	X	very	1222
H	have	122	Y	wood	1121
I	if the	1	Z	next	2122
J		1122	&	why	111
K	o'clock	2121	ing		2222
L		221	tion		1111
M		1221			2212
N	not	11			1112
O	of	21			

If we have four apples and four oranges, and we designate the apples ones, and the oranges twos, with them then we can spell out anything. Thus to spell the word *system* we would from our right to left (so that they may come in regular order for the reader) first place an orange, then an apple, then an orange (=212=S); after withdrawing the S place an apple, an apple, and an apple (=111=Y); next repeat the S (an orange, an apple, an orange), next place an orange (=2=T), next an apple and orange (=12=E), and last an apple, an orange, an orange, an apple (=1221=M).

With a small flag a sweep to the left, two to the right, and one to the left would spell *be*. A great many contractions can be made and are introduced in the code.

Refining Spelter by a New Process.—We have lately been shown a sample of spelter, save the *Iron Age*, showing unusual sharpness of crystallization and brilliancy of fracture, which is said to be as nearly chemically pure as the metal can be made. It was made from common spelter, under a process patented by Mr. A. Harnikel, 83 Maiden Lane, New York. We also have a piece of sheet zinc rolled from it cold, which exhibits great ductility and unusual toughness. We are informed that the specific gravity of the new spelter is 7.2, and that its resistance to dilute sulphuric acid is many times greater than that of any grade of this metal hitherto experimented with. For fine brass, cartridges, German silver and artistic castings, we should presume it would have great utility. The price ranges from eight and a half to nine cents.

India-rubber Hose for High Steam Pressure.—At a late meeting of the Edinburgh Association of Science and Arts, held recently, a short communication was made by Mr. Wm. Firth on the use of india-rubber hose for steam and high-pressure purposes. He exhibited a piece of canvas and rubber hose capable of withstanding a pressure of 4,000 pounds to the square inch, and also several other pieces of canvas and rubber packing, which, he said, were most useful for engineers.

Restoring the Black Color of Cloth.—It is a very common and easy practice to restore faded black colors by simply brushing them over in succession, first with a solution of logwood extract, and then a weak solution of bichromate of potash. Another way is to take first a decoction of crushed nutgalls, and then a solution of sulphate of iron. In either case the black color is easily restored by a brush or sponge. We prefer a stiff brush.

A Light Locomotive.—H. K. Porter & Co., of New York, have completed a locomotive which is said to be the lightest ever made for actual service. The cylinders are but six inches in diameter. It is to haul ore, on a 20-inch track, from the mines of Friedenstraw & Co., of Arizona. Its capacity on a level track is 150 tons.

Phosphoresoence.—A tube of "Canton's phosphorus," or sulphide of calcium, prepared more than a century ago, is found to be still capable of phosphorescence. As it is to this substance that the phosphorescent properties of the new luminous paints are due, the durability of the latter seem to be thus assured.

An all Important Screw.

The identical old model of the telegraphic instrument made by Prof. Morse in 1835 was in a N. Y. court room recently in charge of E. N. Dickerson, counsel for the Western Union Telegraph Company, the owner of the Page patent, in the course of the argument on the demurrer to the petition of the Holmes Burglar Alarm Company. David Dudley Field claimed that the original model of Prof. M. contained a set-screw governing the play of the armature, and that, such being the case, the portion of the Page patent covering that part of a telegraphic instrument could not be sustained. When Mr. D. came to reply, he produced Prof. M's. original model and exhibited it to the court. He declared there was no screw in it such as Mr. F. claimed, and that there never was such a screw there.

The screw in question, and upon which the decision of a case involving many millions of dollars may turn, is not an ordinary screw. It is a screw which was in common use many years ago, before the gimlet-pointed screw was invented. At that time when a carpenter designed to put in a screw, he was obliged to bore a hole in the wood. The invention of the gimlet-pointed screw obviated the necessity of boring the hole, because the screw could be driven into the wood with a tap of a hammer, and then made tight with a screw-driver. The screw in question seems to be, therefore, just such a one as Prof. M. would have been likely to use in 1835, and it would have then served the purpose of a set-screw, such as is now claimed by Mr. P. to be a part of his invention, and which claim is allowed by Judge Blatchford. If this decision is correct, it covers every telegraph instrument in use, and would place every telegraph company at the mercy of the Western Union. On the other hand, it is claimed that the screw in question was put there for some other purpose than to govern the play of the armature. As a matter of fact the screw in question does not now govern the play of the armature, because at the point of the armature opposite the screw there is a hole in the wood, as though it had been but there to prevent the end of the screw from performing that office. Whether that screw was really put there by Prof. M., or was a subsequent addition to the model by somebody, seems likely to be a matter of protracted dispute at law.—*Manufacturer and Builder.*

Good Health.

Sores.

Some time ago, a little child had a pimple on its breast, which became a little sore; an amateur doctor advised a "simple" remedy to be applied to it, which was done; neither the advice nor the remedy cost anything, except the child's life in 48 hours.

A gentleman had a small running sore on the top of his foot; he was anxious to have it "cured up." We advised him to keep it running, but that was troublesome, and it was healed up. In a short time a cold set in, and he died of consumption at the end of a year.

The son of a merchant wanted to reduce a swelling in the side, which began to "run;" general remedies were proposed, with advice to let the "sore" alone. This did not suit his views, so he had it healed up, and died of consumption within two years.

A lady had a sore on the leg; it interfered with her walking. She was impatient to have it "cured up," but was advised as to the consequences, but this was disregarded. The sore was healed up, and she died of consumption.

A lady, aged 70, had a sore leg, and was extremely anxious to have it healed up. She was advised, by all means, to make no application to it, but merely to keep it under control by general remedies. An old woman was applied to, and with various salves a wonderful "cure" was the result. Within a few weeks the lady took dinner in usual health, and died in an hour.

A lady, aged 66, had a long-continued, violent and painful cough. A "running" took place under the toe nail; she feared mortification, and was anxious to have it healed up. She was told that it was the best thing that could have happened to her, inasmuch as it would probably cure her cough and add years to her life; while, by improving the general health, the running might slowly dry up of itself, all of which proved to be so, and now, in her 74th year, she has better health than half our women at 40.

Our object in stating these facts, which have occurred in our own experience, within a comparatively short time, is to impress upon the reader's mind the signal danger of tampering with sores, especially such as are sometimes called "old sores," for they are the outlet to disease, and if injudiciously closed, what they would have discharged will be thrown in upon more vital internal organs, causing apoplexy, consumption or fatal congestions as certainly as the boiler of a locomotive will be shivered to atoms if the fire is continued and all escape of steam is prevented. In all cases of old sores, apply to a physician of age and experience. If that is not practicable, the safest and best plan is first, to diminish the amount of food eaten each day one-half and keep the parts in a cleanly condition by washing them twice a day in soft, milk-warm water until relief is given.—*Hall's Journal of Health.*

Physiology of the Turkish Bath.

Most accounts of the Turkish bath have been confined to general descriptions of the details of the process, and of the sensations experienced during its use; while comparatively little attention has, until lately, been paid to the more important consideration of its influence on the bodily functions. To supply this need, Mr. William James Fleming, M. B., lecturer on physiology in Glasgow, began some years since a series of careful experiments with the action of the bath on his own person. Mr. Fleming's experiments were all made between lunch and dinner, from 4 to 6 P. M. The experiments usually began with a heat of about 170° Fahr. for a few minutes, in order to produce sweating rapidly, followed by a temperature of about 130° Fahr. during the remainder of the stay in the hot rooms.

Omitting a description of the manner in which the experiments were conducted, and also the detailed result obtained, the following are the conclusions drawn by the author from those results. It was shown:

1. That a very large quantity of material can be eliminated from the body in a comparatively short time by immersion in hot, dry air; and although the greater part of this is water, still solids are present in quantity sufficient to render this a valuable emunctory process.

2. The temperature of the body and the pulse rate are markedly raised. The respiration falls at first, but afterward is less influenced than would be expected. Arterial tension is increased, due probably to the rapid action of the heart and the gorged condition of the capillary circulation.

From these the following practical considerations as to the use of the Turkish bath in medicine are deduced: Its most important effect is the stimulation of the emunctory action of the skin. By this means we are enabled to wash, as it were, the solid and fluid tissues, and especially the blood and skin, by passing water through them from within outward to the surface of the body. Hence, in practice, one of the most essential requisites is copious draughts of water during the sweating.

Excessively long duration of the bath seems to produce more or less depression, as shown by the fall of the pulse and temperature after 55 minutes.

The great advantage of the bath seems to be the power it gives of producing a free action of the skin in persons of sedentary habit, or suffering from disease. Beside, and along with this, it is an efficient means, if resorted to sufficiently early, of relieving internal congestion.—*Science Monthly.*

Shaving.

The more I reflect upon the mysteries of neurology and animal chemistry, the more confident I am that, while we are the least suspecting it, trifling errors in our daily life are producing important effects upon our corporeal systems; and I declare it as my deliberate conviction, that the habit, which may almost be styled American, of using the razor upon the face, is sufficient to cause a large proportion of the lamentable evils which affect the human race in this country.

It appears by experiment that the beard, if shaved, grows four to five times faster than if unshorn. In this calculation, an item is omitted which it is difficult to estimate, *i. e.*, the stimulue given the beard, by the first application of the razor in adolescence, the experiments being made upon beards after they have acquired an unnatural rapid growth. The effect of this early stimulus may be fairly counted at double the natural growth; then reckoning the difference in size and weight of the fiber, which is treble, and we find the frightful truth to be, that we raise 30 times the natural quantity of beard! Thus it is evident that the true beard is exhausted at a very early age, after which the system is forced to supply a substitute. Now nature will not submit with impunity to extraordinary demands upon her vigor, and that which requires her to produce in a lifetime 30 times as much beard as she was first inclined to, must certainly be considered as such. She is fatigued in proportion to the effort, let the particular kind be what it may; although her recuperative powers are great, she insists upon having repose, even when working at a rate chosen by herself. If that repose is denied her, she takes her revenge by breaking down the mechanism.—*Journal of Health.*

How to Keep Cool.—On going once into the Medical Museum in Edinburg, on a summer's day, we felt chilly, and on looking at the thermometer we found it at 68, while out of doors it was oppressively warm. Sixty-eight degrees in summer there, is quite cool enough for a sitting apartment; but if you go into a room of that temperature in mid-winter, a feeling of suffocation, of oppressiveness, comes over you. The noon of a day whose morning is 68 will give over 90 in the sun. If on getting up in the morning, every window and door of "*a floor*" are thrown open and thus remain until about sun up, and are then closed, shutters and all, it will be nearly night before the thermometer is materially raised, and persons coming into our office, often exclaim, "how delightfully cool your office is, how do you manage it." If we close our doors in mid-winter to keep the warmth in, may we not do the same thing in summer to keep it out?—*Journal of Health.*

The Week.

Since our last issne we have had delightful, bracing summer weather in this city. The reports from the interior of the State ebow that a high temperature prevailed in the great valleye, while the foothille and the Coast Range rejoiced in the mild summer warmth of the young eeason.

The north wind which blew over the entire length of the State for several days, did considerable damage in some sections by sbrinking the wheat; hut the general prospect for a heavy crop of grain is excellent.

From all the mining counties of tbe State the reports of extended work and valuable developments are highly encouraging, and tend to the assurance that the product, hoth from placer and quartz claims, will be largely increased this year. Equally cheering news comes from all the outlying mining regione of the coast.

It may be seen that the House agreed to all the Senate amendments, increasing the appropriations for the improvement of harhors and rivers on the Pacific coast. And also, that the Committee on Military Affairs reported favorably on Horace Davis' hill to allow S. F. to use a part of tbe Government reservation, near Lime Point, for quarantine purposes.

The excitement over the unusual contest in the late convention at Chicago—an excitement which eeemed to be national rather than partisan—was intense in this city, and apparently etirred all parties. On the last day of the convention the etreets were thronged, and men were ecarcely ahle to restrain their emotion; and finally, when the result was made known, a feeling of grateful relief was widespread.

The ehipmente of hullion and the etate of the mining share market are detailed in the proper columns.

THE *Arizona Quarterly* is the name of a periodical to be issued soon by Thomae Gardiner, of Tucson, Arizona.

A General Business Revival.

There are cheering signs all around of a general revival of business. The depression which prevailed in this city and Stats and throughout the coast for the last two years has very generally ebated. Two years of comparative stagnation in husiness is a severe ordeal for a phsnomenally-active people; hut it is a short time compared to the periodical crises which convulse the commercial and manufacturing communities of the Atlantic seahoard. There the depression is all-pervading and prolongsd, and causes widespread misery. Fortunately, California is not suhject to the major evils which follow over-production and financiel derangement. It is true the stupendous speculativs wave which rolled over the country at the close of the civil war, and stimulated inflation and over-production, reached California at lest and caused a gradual hut severe check to industry and entsrprise. Our mining operations had hegun to flag under the effscts of decreased production and the heavy hut apparently necesssary assssments to meet the tremendous difficulties encountered hy the Comstock compenies. Of course the mining share merket felt the general reaction end fell into a condition of chronic dullnsss, and, as its ramifications are coextensive with the Pacific slope, every industry began to languish. But we think all the signs tend towards a general improvsment in business.

It will he conceded, we helieve, that in the relation of things, an industrial depreseion in Calfornia can only he temporary. For the reeourcee of the great young State are ee varied as they are vast. Gold, wheat, wine—her present great products—alone yield annually eboht $100,000,000, to make no mention of various lesser hut growing industries which contribute greatly to ewell the annual product. Her products are, too, equal to coined gold, and are in demand in the markets of the world. In addition to these home industries, the coutiguous States and Territories are largely tributary to thie city, end literally pour their treasures into her lap. In all of them, mining for gold and silver is the chief industry. They get a large psrcentage of the required capital here, and here also they buy their machinery, tools, and supplies, aud as soon as their mills produce bullion it is shipped to this city. These large sums enter into the general circulation and their distrihution quickens every hranch of husiness. The extent and value of this commerce with the outside mining districts cannot he overetated. For example: a gold or silver mine may he locatcd in tho very core of Arizona and owned in California or at the East. But, wherevcr it may be owned, the parties are likely to come to this city for their mining machinery—where there is the largest experience and the highest skill in that line—just as they would he likely to go to Pittshurg, New York or Boston for locomotives. A similar relation exists to parts of Mexico, and tho importance of this trade will grow immensely with the lapse of time. Some of our foundries get the contract to build a mill for these distant regions; wages are paid to our mechanics; various suppliss are bought here; end, finally, the hullion produced is almost certain to he sent here. All these transactions distribute money and promote husiness generally.

While the revival of business is general, the reaction in this city has heen perhaps a little slower than in the considerable towus of the interior. But it is apparent here in almost every department; for the demand alone for goode for countless mining camps has stimulated the husiness pulse, and enterprise is once moro afoot. So far as the mining share market is concerned, it may he said that the outlook is at least hopeful. Developments on the Comstock, or in Bodie, or in Columbus, or in some district of less note, may occur any day, and lead to a lively revival in mining shares.

WORK ON MINING CLAIMS.—Congressman Daggett, of Nevada, having been appealed to by some of his constitnents as to the proper interpretation of the new law regnlating work on mining claims, answers as follows: After consultation with the Land Commiseioner, I find that he has formally decided that the work on a claim may be done at any time within the 12 months beginning with the 1st January after the location has been made. Consequently locators have an entire year, together with the portion of the year preceding the 1st of January, following the location to do their firet annual work. Hence, a claim located now (May 15, 1880) would hold without work until January 1882, hut eome time between January 1, 1881, and January 1, 1882, the work must he done. This is the interpretation given hy the Attorney-General, and may he accepted as the law.

CONFLICT OF TITLE SETTLED.—We learn from the Bodie papers that the conflict of title hetween the Universal and Maryland Consolidated mining companies, which involved the right to a piece of ground lying hetween the companies, was settled amicahly May 31st, and the injunction suit commenced by the Marylaud has been dismissed. The ground which was in dispute is said to be valuable, as it ehows on the 500 level a vein carrying over four ft. of eolid ore rich in hoth gold and silver. The companies are to he commended for tbeir rational adjustment of the difficulty.

Arizona.—No. 7.

Yuma.

Yuma county occupies tbe soutbwestern angle of Arizona, from Bill Williems Fork on the north to the Mexican boundary on the south, and from Maricopa and Pima counties to the Colorado. Yuma, ths county seat, is es unlike an Amsrican town as possihls. The inhabitants are principally Mexicen, the houses one-story adohs, the streets narrow, and the whole aspect of the plece dirty, yet it is a modern place. It was founded in 1855 and named Colorado City. Then the name wes changed to Arizona City, and finally to Yuma City, in honor of Fort Yuma, on the Californian side of ths rivsr. The Indians (Yumas) constitute ahout half of the population, and thsir village adjoins ths town. An area of above 500 square miles on the north side of the Gila is taken hy ths Castle Dome mining district. Here a great numher of veins, passing from north to south, with an average dip of 75 ft., have heen traced for two or three miles. The ore is argentiferous galena in fluorspar gangue. The most noted mines are Castle Dome, Arkensas, Caledonia, William Penn, Little Willie, Flora Templs and Norme. In the district are also some copper and gold minss. A few miles north of Gila City ars the Cormorant and Las Flores mines, and a placer district to ths west of them; the latter discovered as far hack as 1858.

Forty-seven miles north of Yuma is the comparatively uew Silver district, including the settlement of Eureka. This district has some extremely rich ores. North of Silver is Eureka district, containing the Vernon, Bronco and Buena Vista mines; and north of this the large Weaver district extends heyond Ehrenberg to the Colorado Indian reservation, a narrow strip ahout 40 miles hy 10, lying along the Colorado, principally in Arizona, although a small portion is across the river on the Californien eide. Ehrenherg, ahout 80 miles from Yuma hy land, hut 140 hy water, contains about 600 inhabitants. The houses are of adohe. A few miles higher up the river are the Barriers, where the Colorado rushes through hetween two great rocks only 70 ft. apart. Copper is worked profitahly at the Planet mine, near Bill Williams Fork, and the county ie the principal galena field of the Territory.

Except portions of the Colorado valley, almost the whole of Yuma county is an apparent desert. But all is not desert that so appears. And much of the land needs only water to make it fertile. Over 1,600 square miles lie helow the level of the Colorado, and can he irrigated. There are great plains, or *playas*, of a deep, unctnous hlack soil, as heavy and rich as the land around Stockton. Water can be ohtained everywhere hy digging, and, where thie hae heen tried, along the stage road or railway; grain, vegetables, fruits and alfalfa prove the fertility of the land. The date-palm and paper-fiher yucca are fit plants for portions where water cannot be procured. The butte-like ranges of hills that rise up ont of these plains are full of ore. Gold, silver, lead, copper, ashestos and salt occur ahundantly; also borax, gypsum, selenite, pumice-etone, sulphur and soda.

"Thermal springs," says tbe Yuma *Sentinel*, "in sulphur and chalyheate, occur in many parts, as do those of warm, huhhling, medicated mud. The Indians know well their healing properties in all forms of rheumatism and of skin and venereal diseases. Potter's clay is ahundant enough, and the decomposition of feldspathic rocks has given the desert extensive beds of kaolin." The famous "gramma" grass and bunch grasses which form valuable pasture grow ahundantly. At present the scarcity of wood and water, and the deficiency of agriculture, are great drawhacks to mining operatione in Yuma county. As was previously noticed, the soil aloug the lower Colorado valley is exceedingly rich. Hinton eays that, after the overflow of the river in May and June, "the vegetable growths are amazing; pig-weed persistently runs np to 12 ft. in eix weeks, with a diameter of eight in.; wild hemp grows in ahundance 6 to 12 ft. in the same time; grass, simultaneously, grows from two to five ft. The depth of the overflow on the hottom is from one to three ft., and is eeven ft. above low water. The soil, if kept from overflow and irrigated, is well adapted to cotton, eugar-cane, grain, hemp and semi-tropical fruits."

Maricopa and Pinal.

The central countiee of Arizona are Pinal and Maricopa, which occupy together a rectangle of ahout 170 miles hy 100. As the district hetween Salt river and the Gila, including some of the most valuahle mines in the Territory, is divided between these counties, we will consider them together. The larger portion of Maricopa county extends over the open plains north and south of the Gila, but its northeastern portion, including the lower course of Salt river and its fertile valley, is mountainous.

As has heen hefore stated, a large portion of the Gila bottom, so unattractive and apparently desert, can he made to hear ahundantly hy irrigation, and the advent of the railroad will douhtlese canse this region to improve greatly. As Florence and Phœnix, on the Gila and Salt rivers, and the capitals of their respective counties, are approacbed, the signs of agriculture increase, and the country assumes a cheerful look. Alkali occurs hsre only where the ground hes been overflowed. The most conspicuous nativs plents here are the mesquit, greasewood and the "arrow resd"—a name given to a plant from which the Indiens make arrows, and which forms clumps of reed-like shoots rising from a common root to a hight of six to eight ft. The San Ysidro ranch, of 1,500 acres, is irrigated, and grows abundance of barley, wheat, hay, figs, grapes, etc.

The capital of Pinal Co., with ths classic name of Florencs, is situated on the Gila, 75 miles from Phœnix, 78 from Tucson, and 225 from Yuma. In 1877 its population was said to he ahout 2,000. It is, like Yuma and Tucson, in great part a Mexican town, with edohe houses of one story; but the Anglo Sexon American's cottage, and the "tepis" of the Indian, vary its constructions. Around it is a heautiful valley hottom, with rich, loamy soil. Ths streets are cooled by running streams of fresh water, brought from the Gila, and edged with cottonwood or willow. Extending along the hanks of the Gila, from within 15 miles of Florence to neer ths junction of Salt river, is the long and narrow tract reservsd for the Pima and Maricopa Indians, and kept hy them in a tolerably good state of cultivetion, corn, grain and vegetables attesting their industry. The Maricopas now numhsr ahout 1,500, the Pimas several thousand. The trihes livs in peece with eech other, and intermarry, hut in this cass the hushand addresses his wife in the language of his own trihe. Ths Pimas are slightly the taller men. Thess trihes are said to look for the return of Montezuma, and they have a tradition that their last revered monarch is huried heneeth the Sierra de la Estrella, a range which crops up from the plain north of Maricopa Wells, and west of the Gila, which bere hende to the north. On the southern extremity of these mountaine can be traced the prohle of a gigantic head, eyehrows, nose, forehead, lips and chin carved hy the forces of nature on the rocky slopes. The Indians call this the head of Montezuma, but irreverent Americans think it will do quite as well for Washington.

Phœnix, the capital of Maricopa Co., and of the Salt River region generally, is a neat little town, coustructed principally of adobe, with some brick stores, and inhahited in great part by Americeoized Mexicans. The streets are wide, and bordered with cottonwood trees, and the entire place hetter laid out than most semi-Mexican towns. The approach to the town is through groves of trees and fields of grain, giving it a pleasant aspect, and there are six grist mills in or neer it.

Phœnix is the center of trade of Salt River valley, which contains a great quantity of good land, and much of which is cultivated. In 1877 about 9,000 acres were laid down in harley, wheat and alfalfa. Hayden's near Phœnix, has a flour mill, a store, and several dwellings. About 10 miles from Phœnix, and extending thence to Maryville, on the Salt River hottom, 10 miles further, is a reservation granted to the Papago Indians in 1878.

Wickenburg ie a small town in the northwest part of Maricopa Co., on the borders of Yavapai, and ahout 60 miles from Prescott.

Ahout 15 miles eouthwest of Wickenburg is the Vulture mine, one of the oldest in the north of Arizona, and now, after a period of disuse, in active operation. The ore yields largely in gold. A mill of 80 stamps ie to he erected, and water furnished from the Hassayampa, 12 milee distant. Ahout eight monthe ago thie mine, discovered in 1862, was hought by the Central Arizona mining company, of New York. This company has a capital of $10,000,000, and is ready to expend $200,000, if necessary. The vein walls are mica slate, and the vein, which is 60 ft. wide, dips at an angle of 37°.

Ahout 30 miles north of Phœnix is the Cave Creek gold region. But the chief mining dietricts of central Arizona lie hetween the Gila and Salt rivers, partly in Maricopa and partly in Pinal, the lodes running with a very natural disregard of county lines. These districts, the principal of which are the Globe and Pioneer, are in general well eupplied with wood and water from the Pinal, Apache and Superstition ranges, on which they are located.

Bullion Shipments.*

Since our last issue, we have noticed the following hullion shipments:

Northern Belle, June 2d, $9,101; Tombstone, May 29th, $4,381.16; Contention, May 29th, $8,676.70; Christy, June 3d, $11,358; Con. Virginia, June 4th, $145,878; Paradise, June 3d, $4,496.73; Lseds, May 31st, $4,750; Bodie, June 2d, $5,477; Tombstone, first week in June, $40,000; Bullion, June 5th, $4,000; Northern Belle, June 5th, $9,618.29; per Union Pacific Express Co., June 5th—Ontario, $4,918,79; Barbee & Walker, $1,716.39; Christy, $1,642 87; total, $8.278.05; May product of the Star, $26,400; May product of Bodie, per Wells, Fargo & Co., Noonday and North Noonday, $63,873.95; Bodie Con., $23,389.99; Bulwer Con., $15,651.99; Standard Con., $190,747.19; others, $1,814.85; total, $294,977.97.

*Desirlng to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

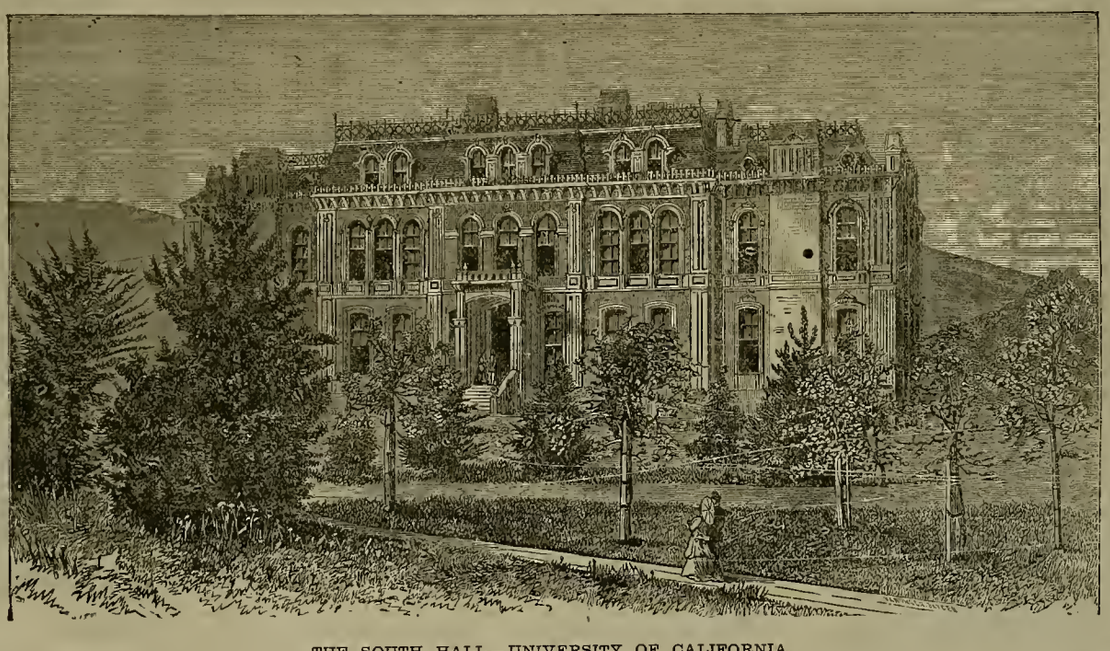
PROCTOR, the astronomer, in the June *Scribner*, punctures the fantastic theories of Jevone about the connection of sun-epots with financial panics.

The University of California.

On Thursday morning, August 5th, prox., another academic year will begin at the University of California. We have deemed it timely, as many of our younger readers are now thinking about taking up new courses of study, to present a few facts about our State University, and to grace the statement with an engraving of the South Hall, the handsomest building of the University group.

Rather than enter upon abstractions as to the art and science of education which are too wearisome for the vacation season, we shall confine our allusions at this time to the leading facts in the history of the University of California and the requirements demanded in those who are admitted to its classes. For these facts we are indebted to the official "Register" of the institution. Though they may already be familiar facts to many of our readers, there are numbers more who never have seen the University nor been informed as to its scope and methods.

The University of California is located in Berkeley, Alameda county. It is a State institution, established by the Legislature in accordance with the Constitution, and intrusted to the care of a Board of Regents, which includes the Governor, the Lieutenant-Governor, the Speaker of the Assembly, the State Supt. of Public Instruction, the President of the State Agricultural Society, the President of the Mechanics' Institute of S. F., the President of the University, and 16 other Regents. To this body of Regents the State has committed the administration of the University, including the finances, care of property, appointment of teachers, and determination of the interior organization in all particulars not already determined by the laws. The instruction and government of the students at Berkeley are intrusted to two Faculties, which have hitherto acted as one body—the Faculty of Science and the Faculty of Letters. The Medical and Law Faculties, in S. F., are distinct bodies. In accordance with the law, eight Colleges have been organized, as will be seen by the following. These Colleges or Courses are designated in the Political Code as follows: 1. College of Letters; 2. College of Agriculture; 3. College of Mechanics; 4. College of Mining; 5. College of Engineering; 6. College of Chemistry; 7. College of Medicine; 8. College of Law.



THE SOUTH HALL—UNIVERSITY OF CALIFORNIA.

The University was instituted by a law which received the approval of the Governor, March 23, 1868. The instructions were commenced in Oakland in the autumn of 1869. The commencement exercises of 1873 were held at Berkeley, July 16th, when the University was formally transferred to its permanent home. Instructions began at Berkeley in the autumn of 1873, two excellent buildings having been constructed at the expense of the State. The site of the University, at Berkeley, is a domain of about 200 acres, situated on the slope of the Contra Costa hills, about five miles from Oakland, facing the Golden Gate. It is traversed by two water courses, is much diversified in aspect, and is adapted to a great variety of culture. A part of the site is reserved to illustrate the work of agriculture and horticulture, and is now under cultivation. The grounds have been thoroughly surveyed and studied, with reference to their adaptation to all the wants of the University. So far as possible, such students as desire to earn something by their manual labor will be employed upon the grounds. For admission to the Colleges of Science, candidates must pass a satisfactory examination in higher arithmetic, in all its branches, including the extraction of square and cube roots, and the metric system of weights and measures; algebra, (Davies' Bourdon or equivalent) as far as the general theory of equations; geometry, the nine books of Davies' Legendre, or their equivalent from another author; English grammar, rhetoric, geography and history of the United States. It is believed that these requirements can be met by a bright and determined scholar residing in any part of the State. The proper text-books are easily procured. The examination is meant to be thorough and strict, but it is not meant to be so technical or exacting as to deter scholars who have not had the best advantages of tuition. Students who show a capacity to pursue with profit the course marked out, are sometimes admitted on condition that they will make up their deficiencies. At the same time, thorough preparation, where it can be had, is of the greatest importance.

Tuition in the Colleges of Science and of Letters is free to residents of California. Students from other States pay a matriculation fee of $25, and a tuition fee of $50 per year. A small charge for chemicals is made in the chemical laboratory. Young ladies are received as well as young gentlemen. Board is obtained in private families at Oakland and Berkeley, at from $20 to $30 per month (lodgings included). The hours of recitation are such that many students reside in Oakland and San Francisco. Steam connection with S. F. brings the University within one hour of that city.

The rules of the University are few; the exactions are strict. Good behavior, under all circumstances, regularity and punctual attendance at all appointed exercises, diligence in study, and the maintenance of thorough scholarship, are expected from all the students. Failures or negligence in any of these respects will render the student liable to private and public admonitions, to dismissal, and, in cases of heinous misdemeanors, to expulsion. Formal reports are not regularly transmitted to the parents, but the Professors will be ready to give information respecting the standing of a student, to his parent or guardian, whenever it is requested.

Oregon Swamp Land Commission.—Sec'y Schurz decided June 7th, the Oregon swamp land cases arising in the Oregon City Land Office which were appealed last November. The Secretary reverses the decision of the General Land Office, and holds that the Oregon swamp grant was one *in priori*, that there has not been any forfeiture, either as to the land surveyed prior or subsequent to March 12, 1860, or whether selected within two years from the adjournment of the State Legislature or not, and consequently that all lands in Oregon actually swamp, must be certified to said State. This, and the Dennis Crowley decision, terminates in favor of the State of Oregon, all disputes between the U. S. and the said State, that have been pending under the Swamp Land act of March 12, 1860, for 20 years.

Cheap Concentration.—It appears that the low-grade ores of the Freeland mine in Colorado are concentrated at the rate of 50 cents per ton. This information was given to the *Enterprise* by Mr. Osbiston, a well-known Comstock mining expert, and now manager of the Freeland. The Freeland machinery is driven by water-power; and it is suggested that the mines of the Comstock, several of which contain thousands of tons of a low-grade ore, could also use water-power by running their ores through the Sutro tunnel to Carson river. It is evident that the time is coming when the poor ores of the Comstock will be utilized and made profitable by simple and cheap concentration.

Carson and Colorado Railroad.—On Monday, May 31st, work was commenced on the Carson and Colorado railroad. Mr. Yerington, President of the company, threw up the first shovelful of dirt about one-half mile east of Mound house, near Carson, and immediately afterward about 80 workmen, under the direction of Supt. Laws, were set to work. The total force of white laborers employed on the road numbers nearly 300, who receive $1 per day and board. A gang of 100 Chinamen are at work at Walker's lake, in a barren section where, from lack of wood and water, white men have refused to work.

Patent Office Models.

There is a common impression abroad that inventors no longer need prepare models to send with their applications for patents to Washington, and that drawings alone will now answer the purpose. This is a mistake. Some weeks ago the Commissioner of Patents issued an order that models need not be filed "except when required by the examiner in charge." It is this order which has led to the misapprehension.

It happens, however, to be a fact that many of the examiners can, with difficulty, "read" drawings, and require the model in order to understand the drawings. An inventor is, therefore, liable to be called upon any day for the model in any case, and in order to be prepared to meet the call promptly, the inventor should send his model, through his agent, with the specifications and drawings.

If the case is forwarded without models, there is liability of great delay, which generally happens when least expected. As the inventors furnish the models, and as they are necessary for making proper drawings, it is much better to have them, anyhow.

After the case is filed in the Patent Office, and has waited its turn two or three weeks, when it is taken up by the examiner and he demands a model, it delays the business of procuring the patent very materially, since, instead of receiving definite news about the application, the inventor receives a notice to furnish a model. Inventors on this coast would be then greatly delayed. It will take a week each way for the letters, a week or more to make the model, and then the case must again wait its turn. Then it is difficult to make a model to agree exactly with the drawings already filed, and these must agree according to the Patent Office rule. It may be, therefore, necessary to make new drawings, which will entail still further delay, since the specification must then be altered to suit the changed drawings.

Altogether those familiar with Patent Office affairs will see that it is as necessary now to furnish models as it was before the Commissioner's order was issued.

Gold and Silver in N. J.—The N. Y. *Sun*, May 22d, tells a story of discoveries of gold and silver near Plainfield, N. J., which excited the most lively interest. The story runs that the discovery occurred in an old and abandoned copper mine known as the Field mine, and that the lucky finders obtained assays from the rock of a highly satisfactory character. The mine was at once leased for 12 years, and a prominent capitalist, after a "thorough inspection and examination," offered to advance all the money required to carry on the operations. Already, it is stated, some $50,000 worth of machinery had been ordered. And shortly—the account adds with charming *naivete*—"the ore, or what is said to be ore," will be transported to the mills which have been secured at Plainfield. Nothing seems to excite such a lively faith as gold and silver mines.

Montana Lead Bullion.—We learn from the Glendale *Atlantis*, Montana Ter., that the smelting works at that place had shipped June 1st, 184,000 pounds of bullion (about 19 narrow-gauge car-loads), besides having some 10 car-loads on hand. Several lots of copper matte were also shipped.

The Treasury Department has purchased 438,000 ounces of fine silver, for delivery at the Philadelphia and S. F. Mints.

The Old Vulture Mine.

The Vulture mine, once the most celebrated in Arizona, is now the property of Chicago capitalists, and is styled the Central Arizona Mining Co. The property is situated in Wickenburg district, Maricopa Co. The operations of the original company were attended with great difficulties, not the least of which was the scarcity of water. The cost of transporting the ore from the mine to the mill was enormous. The present company has wisely resolved to keep mine and mill together. For this purpose they have undertaken the project of conducting the water from Hassayampa creek to their new mill, a distance of about 15 miles. We learn from a note just received from a correspondent at Seymour, that the mill is progressing rapidly, and that all the sheet-iron for the water-pipe has arrived from Pittsburg, Pa. The pipe is made on the ground at the rate of 2,500 ft. daily, and is more than half completed. Hassayampa creek will afford a copious supply of water for all the requirements of the mill and have a large reserve. It is estimated that the cost of conducting the water from the creek to the mill will be about $60,000. The new mill will be finished, it is hoped, in the early fall, and will be the largest and best equipped in Arizona.

The ore body of the Vulture is reported to be of great width, holding the gold free, and averaging from $10 to $12 per ton. Owing to the size of the vein or body, and the facility with which the ore can be mined, it is estimated that the expense of mining and milling will not exceed $4 per ton. Work on the new double compartment shaft was commenced March 1st, and has been since carried on night and day. The east compartment is now 200 ft. deep, and the west 185 ft. Levels are being run at the depth of 150 feet; and, as the ground is easy to work, good progress is made in shaft and levels.

We believe the original company on this celebrated mine was not successful, for it must be remembered that in the early days of Arizona the wily and ever-present Apache rendered prospecting and mining exciting, but hardly profitable, to say nothing of the extraordinary expense of labor and supplies in that wild and vacant country. The prospector is tempted fate. The miner literally held the pick in one hand and the rifle in the other. While one party entered the mine to work another stood guard on the surface to prevent a surprise from the savages. At the mill, rifles were kept within reach of the workmen. But the Apache has gone, to return and vex no more. In nearly every part of the Territory mining and business operations, thanks to the present and coming railroads, may be carried on without molestation and at reasonable expense. Under these new and auspicious conditions the Central Arizona mining company has a fair opportunity to develop its splendid mine, and to render the later history of the Vulture mine more famous than its first.

Rich Gold Ore.—According to the Sacramento *Bee*, an abandoned gold quartz claim at Walltown, nine miles south of Folsom, has just disclosed a rich nest of ore, only two ft. from the point where work was stopped several years ago. Some idea of the richness of the rock in the claim, which is a sort of decomposed quartz and is easily removed with a pick, may be formed when it is known that from nine sacks of the ore 42 lbs. and 10 ozs. of gold were taken, and as the value of the gold is $17.50 an oz., the lucky finders cleaned up about $9,000. The "pocket" is about the size of a 25 by 15 room, and it is estimated that there is in it quartz which will "pan out" over $100,000. The ore is easily milled, and can be worked with satisfactory results in a hand mortar.

Extraordinary Work.—They are doing extraordinary work in the Sutro tunnel. During the month of May, says the *Territorial Enterprise*, the north branch of the Sutro tunnel was extended 321 ft., 106 ft. of which was during the last week of the month. During the same month the south branch was extended 315 ft., 148 ft. during the last week of the month. This is all splendid work, but that done in the south drift is the best ever done on the Comstock, and it is boldly asserted, the best ever done in the world. It is really remarkable when we consider that the branch is 10 ft. wide and 8 ft. high.

The Auburn Mines.

The revival of gold mining in California is general, and old Auburn, in Placer county, feels the new activity. During the past year a large amount of capital from the East has engaged in mining enterprises in that region, which has aroused general interest in its mines of gold quartz. The Julian mine, five miles below Auburn, situated on the granite belt, was sold a few months ago to Eastern parties for $200,000, and was considered a cheap property. The Crater mine, formerly owned by the St. Patrick Co., is now under individual ownership, and is being managed with system and profit, its product in the last four months having been $50,000. The Bellevue, another mine that failed in the hands of San Francisco men, is making a regular profitable output under local control and ownership. The Shurtleff mine, on Duncan hill, a locality that is prolific in quartz ledges, has for several years given a yield of over $25 per ton. The Conrad, on the same hill, an old location, is being opened by E. W. Roberts, an experienced miner, who recently made his first crushing of 20 tons, which gave a yield of $106 per ton. He has opened on a fine ledge that averages from 20 inches to two feet in size. The ledges of that locality are in metamorphic state. The Ohio, in the vicinity of the Crater mine, is another very promising mine in the course of development. The custom mills are kept constantly running on ore for prospectors or companies not owning mills. One of these custom mills reports that in a crushing of over 1,000 tons from 25 to 30 different ledges, the average yield was over $22 per ton. There are also in the country to the south of Auburn, some old river bed deposits found in the ridges, formerly worked, but latterly receiving more attention, as the price of water has cheapened, and several such claims are now being worked to a profit. The Yankee Hill Co. cleaned up last week, after a 10-days' run, $2,000, on a labor and water expense of about $400. Altogether the country about Auburn, by means of its fruits and mines, seems to have entered upon a new era of prosperity.—*Grass Valley Union.*

ARIZONA.—It is assumed by most writers on Arizona that it is none other than the famous "Arazuna" of the Spaniard. Mr. R. A. Wilson, in one of his works on Mexico, says: "We have the following record in evidence of the masses of silver extracted at Arazuna: Don Domingo Asmendi paid duties on a piece of virgin silver which weighed 275 pounds. The king's attorney (fiscal) brought suit for the duties on several other pieces, which together weighed 4,033 pounds. Also for the recovery, as a curiosity, and therefore the property of the king, of a certain piece of silver of the weight of 2,700 pounds. This is probably the largest piece of *pure* silver ever found in the world." Ward, the British minister to Mexico, says in his report that he saw the correspondence in regard to these masses of virgin silver, that he obtained a certified copy of the decrees, and that its authenticity was unquestionable. The aggregate weight of those nuggets amounted to 6,908 pounds, which, at a valuation of $17.60 per pound, gives the sum of $121,580.80. Silver nuggets have been picked up of late years in many parts of the Territory, and veins containing the precious metal in an almost pure state have been discovered.—*Conservative.*

CATFISH IN THE BELCHER MINE.—During the late suspension of pumping in the Belcher, the pump nearest the surface was overhauled, and at the clack were found a number of catfish, one being nine inches in length and fat as mud. There were some 20 smaller ones, ranging in size down to less than an inch in length. About two years ago W. P. Bennett purchased a lot of these fish and placed them in the Belcher tank on the surface, where they grew and bred. A very fine wire screen was placed over the outlet of the tank to prevent their escape. These fish must have wiggled through this screen when very small and then found their way through the connecting pipes to the pump column. It is a mystery, however, how these fish could have lived in the hot water raised by the pumps, for if one from ordinary water is placed in it, it immediately scalds the skin off. But the fact that they did live in it and thrive on it is attested by their presence there, and the fine condition of the large one taken out.—*Gold Hill News.*

Rainfall West of the Sierra Nevada and Cascade Mountains.

[By PROF. JOHN LE CONTE.]

At first sight, we might suppose that as all the great belt of country lying west of the Sierra Nevada and Cascade mountains, is exposed to the full influence of the vapor-bearing west winds coming from the vast water surface of the Pacific ocean, it would receive an unfailing and bountiful supply of rain. The interposition of the comparatively low coast ranges, between the great valleys of California and of Oregon, and the vapor-bearing winds from the Pacific, could hardly be expected to produce any very great diminution in the supply of moisture reaching these valleys. Yet the fact is far otherwise. Indeed west of the coast ranges, no less than on the great California valley, the rainfall, although usually sufficient to assure a remunerative return to the farmer, is frequently very scanty, especially the southern portions. Considering the comparative proximity to the great water-surface, and the direction of the prevailing winds, it is astonishing how little rain falls on the Pacific coast between San Diego and Cape Mendocino. Not only is the amount of rainfall smaller than might be expected, but it is quite irregular, and thus involves the element of uncertainty. For example we have the following extreme fluctuations in the annual rainfall at San Francisco and at Sacramento:

SAN FRANCISCO.		SACRAMENTO.	
Season.	Rainfall.	Season.	Rainfall.
1850-51	7.40 in.	1850-51	4.71 in.
1861-62	49.27 in.	1861-62	35.65 in.

Table of Rainfall.

The following table exhibits in a striking manner the increase of rainfall as we advance northward along the Pacific coast.

Rainfall West of Sierra Nevada Mountains.

Stations.	North Latitude.	Coast or Valley.	Average Rainfall in Inches. Spring.	Summer.	Autumn.	Winter.	Year.	Extent of Record in Years.
Fort Yuma	32° 44′	.....	0.25	0.68	1.49	1.04	3.46	9¾

Abnormal Distribution of Rain on the Pacific Coast.

A glance at the foregoing table reveals several remarkable and seemingly abnormal results in relation to the distribution of the rainfall along the Pacific coast. (1.) The annual rainfall augments with increase of latitude. Thus, the annual amount of rain varies from less than four inches in the Yuma and Gila deserts, at the head of the Gulf of California, to eighty inches on the coast of Washington Territory. Now it is well known, that the general law is that the average fall of rain is greatest near the equator, and diminishes as we proceed towards the poles. This law evidently depends upon the relation which the tension of the vapor at the water surfaces usually bears to the efficiency of the solar radiation incident in different latitudes. Under normal conditions, the greater perpendicularity of the solar rays, incident in lower latitudes, imparts a higher temperature to the oceanic surfaces, consequently a higher tension to the aqueous vapors contained in the superjacent air; so that an equal reduction of temperature must precipitate a larger amount of moisture in a warm than in a cold climate. Thus the following table shows the average annual rainfall in different latitudes, according to the estimates of Prof. Loomis and Guyot; to which are added two columns, likewise indicating the decrease of rainfall with increase of latitude:

Loomis. Rainfall in ins.	Lat	Guyot. Rainfall in ins.	Annual Rainfall in inches.		Annual Rainfall in inches.	
104	0°	100	Tropics.....	102	Tropics..	96
85	20°	80	Temperate zone.....	36	Italy.....	45
70	30°	60	Frigid zone	12	England..	37
40	40°	40			N. Germany..	22½
30	50°	30			St. Petersburg...	17
25	60°	20				
20	70°	10				
	80°	5				

It is evident that on the Pacific coast this general law is completely reversed, and it is equally obvious that there must exist some active physical cause adequate to produce this anomalous result.

(2.) The second abnormal result indicated by our table of rainfall on the Pacific coast is that at Cape Mendocino (or about latitude 40° to 41°) there is a sudden increase of the annual rainfall from about 20 inches to 44 inches, or more; with a more gradual augmentation from this latitude in advancing northward along the coast. (3.) The third abnormal result, indicated by the same table, is that between San Diego and Cape Mendocino (from latitude 32° 42′ to latitude 40° 26′) scarcely any rain falls during the three summer months; but that north of the latter point the rains are more uniformly distributed throughout the different seasons, although the winter still continues to be the period of greatest precipitation. The contrast in this respect between the distribution of the rainfall according to seasons on this coast and that on the Atlantic coast of the United States is strikingly exhibited by the following table of the average rainfall, according to seasons, at various points along the latter:

Table of the Rainfall Along the Atlantic Coast of the United States.

Stations.	North Lat.	Average Rainfall in Inches. Spring.	Summer.	Autumn.	Winter.	Year.	Extent of Record in Years.
Fort Pierce	27° 30′	9.56	22.62	14.74	10.80	58.02	6¾
Jacksonville	30° 20′	10.91	21.07	12.04	8.70	52.72	6
Savannah	32° 5′	10.05	20.02	8.03	8.42	48.32	23½
Charleston	32° 47′	8	22.93	8.42	8.27	45.11	22
Fortress Monroe	36° 59′	10.17	15.32	10.57	10.67	47.04	10½
Philadelphia	39° 57′	10.19	10.23	9.37	9.51	41.10	23
Fort Columbus	40° 41′	11.35	11.05	10.07	8.91	41.95	23
Newark	40° 45′	11.58	11.58	10.84	10.04	44.85	23½
New Haven	41° 18′	10.84	11.71	11.53	10.70	44.78	21½
New Bedford	41° 38′	10.73	9.75	10.52	10.42	41.42	54
Providence	41° 50′	10.54	10.14	10.48	10.22	41.33	35
Boston	42° 22′	10.40	9.51	0.48	9.35	33.54	20
Concord	43° 12′	0.54	10.57	11.31	0.27	40.00	83
Hanover	43° 42′	9.57	11.09	10.53	9.03	40.32	19
Brunswick	43° 54′	11.71	11.71	11.42	0.94	44.68	32
Gardiner	44° 11′	10.57	10.46	10.49	10.27	42.00	27
Fort Sullivan	44° 54′	8.57	10.46	9.46	10.02	30.41	83
Washington	38° 53′	10.10	12.77	8.10	10.02	41.65	5

(4.) The fourth fact shown by the table of rainfall on this coast is not anomalous, being in conformity with the general laws of rain. It is that the amount of annual rainfall in the great California and Oregon valleys is considerably less than it is on the sea-coast west of the the Coast ranges. This is much more conspicuously true in latitudes north of 41°, where it is surprising how quickly the atmosphere becomes drained of its vapors as we leave the coast and proceed inland. The Coast Range mountains along this portion of the coast being cooler, act more powerfully as condensers as the vapor-bearing winds are forced up the western slopes.

CHESAPEAKE AND DELAWARE SHIP CANAL.—It is said that the congressional committee to whom was referred the question of a proposed ship-canal to connect the Delaware and Chesapeake bays, will shortly report (if they have not already done so) in favor of a route leaving the Chesapeake at Queenstown, Md., running across to Lewes, Del., and terminating at the Delaware bay about five miles above the Delaware breakwater. The total length of this line will be 51 miles. The canal will be 200 ft. wide and 25 ft. deep, and will therefore be capable of accommodating vessels of the largest class, and of allowing two such vessels to pass each other. On this route there are no natural water ways, and the whole line will require to be excavated. There will be no locks except tide-locks. It is believed that the canal can be built for $31,000,000, though the report it is understood, will ask for a somewhat larger appropriation. Respecting the advantage of this much discussed project, it is to be noticed that vessels bound to any European port north of the Mediterranean would be able, by going through the canal, to save the time consumed in sailing down the Chesapeake and around the capes. It would make the trips of the trans-Atlantic lines of steamships entering and leaving the Chesapeake nearly two days shorter. The report will also recommend that the canal he constructed under the supervision of the War Department.

WRECKLESS WRITING.—The young mining departments of the great dailies are impatient to make a reputation for smashing something—to become terrible, as it were. One prints correspondence which annihilates a company per line, and such companies as the North Bloomfield and Spring Valley at that, and hydraulic mining in general; still the gravel mines of California continue to yield 12 to 15 millions per annum, and have averaged that for 20 years. This correspondence admitted in the financial columns of the *Tribune* is calculated to do serious injury; but such dangers are incident to building a mining market on "news." Some irresponsible correspondent may come along and demolish months of reports and telegrams from experts and superintendents with one fell swoop of his pencil.—*Bullion.*

A PARTY of Mexicans have eight arastras in regular operation in Beveridge district, Inyo county. The ore worked yields $25 in gold per *carga* of 300 lbs.

Certificate of Co-partnership

OF

GEO. SPAULDING & CO.

We, the undersigned, do hereby certify that we compose a partnership transacting Printing Business in the City and County of San Francisco, State of California, under the name and style of George Spaulding & Co. That the names in full of all the members of such co-partnership and their respective places of residence are as follows, viz.: George Spaulding, San Francisco; J. Munroe Miller, San Francisco; Dwight Germain, San Francisco.
In witness whereof we have hereunto set our hands and seals, this first day of May, A. D. 1880.

GEORGE SPAULDING,
J. MUNROE MILLER,
DWIGHT GERMAIN.

State of California,
City and Co. of San Francisco. } ss.

On this twenty-seventh day of May, A. D. 1880, before me, Sam'l S. Murfey, a Notary Public, in and for the said City and County, residing therein, duly commissioned and sworn, personally appeared George Spaulding, J. Munroe Miller and Dwight Germain, known to me to be the persons described in and who executed and whose names are subscribed to the within and annexed instrument, and they each acknowledged to me that they executed the same.
In witness whereof, I have hereunto set my hand and affixed my official seal, the day and year in this certificate first above written. SAM'L S. MURFEY, Notary Public.
"Endorsed"—Filed, May 27, 1880.
WILLIAM A. STUART, Clerk.
By J. WHALEN, Deputy Clerk.

MONEY TO LOAN!

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

THE BEST NEWSPAPER FILEHOLDER AND ADJUSTABEL BINDER can now be had at this office. It consists of elastic fastenings, with stiff, cloth covered side. Size suitable for a full volume of this paper, $1. To our subscribers 75 cts., mailed postpaid.

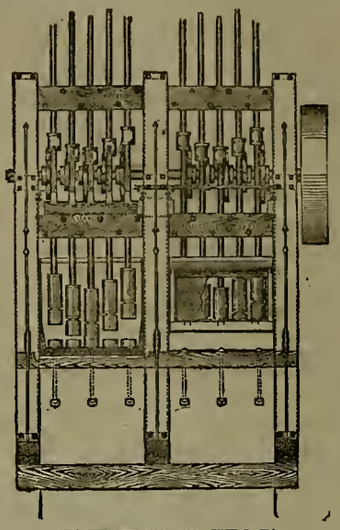
Machinery.

GOLD AND SILVER

Grinding and Amalgamating

MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S

Wrought-Iron Frame

FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING JUNE 1ST, 1880.

228,260.—GUIDING HEADERS—W. H. Keene, Woodbridge, Cal.

228,267.—PNEUMATIC ANNUNCIATOR—D. and T. Morris, S. F.

228,234.—ELEVATOR GOVERNOR.—I. H. Small, S. F.

228 419.—EYE FOR HOES—J. R. Thomas and T. A. Paul, Calpella, Cal.

228,198.—PRESERVING FRUITS—H. G. Hulburd, Placerville, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patsnt Agency, the following are worthy of special mention:

RAILROAD RAIL JOINT.—Silas Harris, 7 Liberty St., S. F. The ordinary form of rail joint is made by means of fish-plates on each side of the rail, crossing the joint, slots heing formed through the fish-plates and rail, so that holts may pass through them, these holts heing secured in place hy nuts. The difficulty with this connection is that the nuts are continually being shaken loose until the holts fall out and the plates drop off, leaving the meeting ends of the rails without proper support. This difficulty is ohviated hy discarding the screw holts entirely, and using holts which are held in place hy an eccentric, which, while it can he loosened when desired, will not jar loose hy the passage of trains. This device consists in hinding the fish-pla e against the sides of the rail hy means of an eccentric horizontal holt or fastening connected with said fish-plats through peculiarly-formed holts or plates. The eccentric joins the parts together immovahly, and dispenses with all nuts or screw-holts.

ELEVATOR GOVERNOR.—Isaac H. Small, 574 Brannan street, S. F. Patented June 1, 1880. No. 228,284. This invention relates to that class of elevators wherein the safety-clutches are operated hy rotating governors, independent of tbe hoisting rope. As the elevator is raised and lowered hy the cahle in the usual way, the friction ratchet, or rope connected with the end of the governor-shaft, causes the governor to revolve whenever the cage is in motion. If at any time the rope should hreak or any accident occur which would cause the epeed of the elevator to be accelerated to a higher degree than safety warrants, theu the governor revolves with proportionate speed. At a certain point the collar of the governor will have moved the sleeve with its dog far enough forward to release the end of the hell-crauk lever from said dog. The spring then draws the hell-crank lever down and moves the bar or rod over, and this, in its turn, by heing counected with the arms of the dogs or catches, throws said dogs into the sides of the guides, and they hold the elevator.

GUIDING-HEADER.—Walter H. Keen, Woodbridge, San Joaquin Co., Cal. Patented June 1, 1880. No. 228,260. This invention contemplates forming a peculiar jack-staff, carrying the caster guide-wheel helow, and arranged above as a guide for the cutter-har level, the whole heing in front of the driver, so that a seat may he provided at the rear end of the heam, upon which the driver may sit during his work. The tiller for steering the header is swiveled on the rear end of the cutter-har level, and so combined with it as to serve also as a means of raising or lowering said lever. It further consists in forming in a peculiar manner an automatically movahle fulcrum for the cutter-har lever, to keep the header on an equal halance, so that the cutter-bar is raised with little friction, and the strain relieved from the links connecting the cutter-har frame with the pole carryiug the guide-wheel and driver.

HAME RING.—A. J. Larsen, 420 Jackson St., S. F. Patented May 25, 1880. No. 227,982. This invention relates to improvements in what are known as the "hame-rings" upon working harness; and it consists in a rein-leading ring for hames, consisting of the slotted, ewiveled rod provided with the semi-circular extension, the sliding-ring section provided with the hook or loop, and a coiled spriug, all attached to the hames. In driving horses to or from their work without the vehicle it is customary to douhle the reins up and push them through the hame-ring upon the near side, or to hang them upon the end of the hame itself, and when the hridle is removed for the purpose of feeding it is hung upon the hame. In either case the reins or hridle are liable to become displaced and fall to the ground, and this invention prevents such accidents, hesides making it very easy to introduce or remove the reins.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, Prof. Davidson in the chair. Among the gifts to the Museum, was a peculiar spider, akin to the scorpion, from P. S. Buckminster, of Bellville, Esmeralda county, Nevada. It was classified as *Galeodes*, and is the first of the species known to have heen found in America. Mr. Gullichsen, of the Pacific Rolling Mills, presented, through Prof. Davidson, some pieces of crystallized iron taken from a cavity found on the hreaking up of a shearing machine, supposed to have heen cast in the ordinary way. The crystallizations, which had hecome shaped in a sort of cavity within the iron, were formed like miniature cedar trees, were very heautiful. The Smithsonian Institute, at Washington, presented, through Prof. Baird, a collection of 178 specimens of marine invertehrates, collected hy the U. S. Fish Commission on the Atlantic coast, to he retained for scientific comparison.

Mr. P. S. Buckminster read a paper on "Cyclonic Winds," which he described as moving from right to left. He observed small whirlwinds in Nevada, having a diametar of 20 ft., with half a dozen smaller fringing whirlwinds of a foot diameter, moving at 20 times the velocity, moving within its area in a circle, thus showing whirlwinds to have three separate motions of different velocities, the third heing the forward motion of the whole column of air. He argued that electricity is either an involved agent or an evolved condition of the storm. Mr. Buckminster then read another paper on soms "ice forms" in mines of Nevada, very unlike crystals formed in the external air. Hs thought the peculiar determination of form was not accidental. At the closs, Prof. Davidson offered some highly interesting explanations of how the formations took place, quoting freely from Sir John Herschell, Mr. Elliott and Prof. Jos. Le Conte, who had previously ohserved, and Prof. Le Conte had explained, their formation.

Mr. C. W. Brooks then made some remarks on ethnology, saying: The many interesting problems of ethnology, which arise while tracing the early migrations of races have led us to consider the scattered fragments of an ancient people whose descendants may now be traced over large groups of islands in the Pacific ocean.

A careful study of all co-related evidence leads us to the firm helief that the present hed of the Pacific ocean was once an area of earth's surface ahove the level of the sea, and hecame suhmerged hy some spasmodic catastrophe when the equilihrium of earth's forces was temporarily disturhed, involving conditions which depressed new heds for water, and while estahlishing new water-lines as the houndaries on continents, necessarily formed islands of peaks and mountain summits lofty enough to remain unsuhmerged.

Such a Polynesian continent was undouhtedly inhahited hy early ancestore of the North American Indian, the Japanese, the Hawaiian, and the hroader classifications we term the Malay race. All races at the pressnt day are, to a certain extent, composite or mixed races; hut a majority of the Hawaiians are prohably descended from the ancient Malay race which formerly inhahited a vast continent which many thousands of years ago was hroken up and depressed amid one of those mighty physical convulsions which have at long hut systematic periods of interval changed the form of continents hy upheavals and depressions of large hut local areas of the earth'e crust.

Later intermixtures of races may he traced, hy a careful study of traditional histories, among the different groups of the Polynesian Islands, which should now he carefnlly collected and preserved hefore the impending chauges of civilization, now moving westward, and permeating the whole area of the Pacific, allows them to fade from memory, or pass heyond recovery of scientific research.

To perpetuate such testimony of certain historical facts relating to the Hawaiian group of islands, on which the distinguished English navigator, Captain James Cook, attempted to impose the name of Sandwich Islands, hy right of so-called discovery, Hon. Henry A. Peirce who, for eight yeare past, has resided at Honolulu as Minister Resident of the United States of America, has prepared, at my request, a thorough reliahle etatement of the earliest discoveries of these islands hy various navigators of modern, commonly called western natione. Mr. P. has a thorough knowledge of the Hawaiian language; having learned it over 50 years ago, when he first landed upon those islands, in 1828, since which time he has resided there nearly quarter of a century, and conversed frequently with many intelligent natives who were present and witnessed the landing of Capt. Cook. His sources of exact information are therefore not only exceptionally good, hut are also most trustworthy and reliahle.

Mr. Brooks then read a detailed account, prepared hy Mr. P., of all the voyages where early navigators reached the Hawaiian Islands.

AVERAGE SPEED ON RAILROADS.—The average speed on English railroads is 46 miles an honr; on the French roads, 37½; on the German, 40, and on the American, 37. On the English roads, 6½-ft. driving wheels are quite common; and some of the fast lines have 8 and 9-ft. wheels, and one line has 10-ft. wheels.

Pacific Coast Affairs in Congress.

Ths House Committee of Conference on the River and Harbor Appropriation hill agreed, June 9th, to retain in ths hill all the Senate amendments increasing the amounts for Pacific coast improvements.

The House Committee on Military Affairs reported favorably, June 9th, the hill of Horace Davis, to allow the city of San Francisco the use of a portion of the Government reservation at Lime Point, hetween "The Points" and Point Covella, San Francisco harhor, for quarantine purposes, for such time and under such restrictions and regulations as the Secretary of War may require. The point sslected for the station was recommended hy the Secretary of War at the suggestion of Gen. McDowell, who thinks it morc conveuisnt and hetter adapted for a quarantine station than Angel island, which was first suggested.

Favorahle reports from committees on the following matters of interest to the Pacific coast were made to ths House. A hill to pay Edw. Vollum a sum not to exceed $700 for property lost when the hrig *Fawn*, hound for Fort Umpqua, Or., 1858, was wrecked. A hill authorizing the deputy-inspectors of customs at San Juan island, Puget Sound district of W. T., to enter and clsar vessels. A hill providing that the validity of any patents for puhlic lands shall not he questioned in suits or court proceedings after the expiration of 10 years from the date of issue, except when the issue was ohtained hy fraud or allowed hy mistake. The hill providing for ths survey and disposal of unsurveyed lands helonging to the U. S., was reported hy the House Committee on Puhlic Lands June 9th, to he printed and recommittsd.

Bills granting pensions to Rebecca E. Hasken, Mary J. West and Margaret Costello of S. F. were reported favorahly to ths House.

A DIGEST of decisions of ths Land Office in relation to mining laws; a list of patented mines; the laws regulating the disposal of mineral land; and the instructions of the Land Officc thereunder, are to he found in "Copps' Hand Book of Mining Laws," recently puhlished. This is a little work useful for every miner or prospector in the country. Price $1, for sale hy Dewey & Co., 202 Sansome street, San Francisco.

EVERY new suhscriher who doee not receive the paper, and every old suhscriher not credited on the lahel, within two weeks after paying for thie paper, should write personally to the puhlishers without delay, to secure proper credit. Thie is necessary to protect ourselves and euhscrihers against the acts and mistakes of others.

REPRESENTATIVE DAVIS, at the instance of the Bunker Hill Association of California, has procured an order from the Sec'y of War, directing that a Federal salute he fired on the 17th instant from all the forts in San Francisco harhor.

Pocket Mining Atlas,

Containing tbe principal mining districts in the United States. Complied from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of $1. Address, Dewey & Co., 202 Sansome St., S. F.

Nothing short of Unmistakable Benefits

Conferred upon tens of thousands of sufferers could originate and maintain the reputation which AYER'S SARSAPARILLA enjoys. It is a compound of the best vegetable alteratives, with the Iodides of Potassium and Iron, and is the most effectual of all remedies for scrofulous, mercurial or blood disorders. Uniformly successful and certain in its remedial effects, it produces rapid and complete cures of Scrofula, Sores, Boils, Humors, Pimples, Eruptions, Skin Diseases and all disorders arising from impurity of the blood. By its invigorating effects it always relieves and often cures Liver Complaints, Female Weaknesses and Irregularities, and is a potent renewer of vitality. For purifying the blood it has no equal. It tones up the system, restores and preserves the health, and imparts vigor and energy. For forty years it has been in extensive use, and is to-day the most available medicine for the suffering sick anywhere.

FOR SALE BY ALL DEALERS.

Attend to This.

Our subscribers will find the date they have paid to printed on the lahel of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. Mining & Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the largest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States.

DEWEY & CO.,

Propeller Engines either High Pressure or Compound Stern or Side Wheel Engines.

Mining Machinery.

Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

Engines and Boilers of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended to and at very moderate rates.

PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

Manufacturers of

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING, AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERT. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Bailey Air Compressor, Howell's Improved White Furnaces, Walker's Compound Steam Pumps, Etc.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstains, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens Mill owners using Battery Screens extensively can contract for large supplies at favorable rates Orders solicited and promptly attended to.

All ordinary mending, sewing on buttons, etc., free of charge. ☞Orders left at the office will receive prompt attention. Work called for and delivered to any part of the city free of charge.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

COFF'S HANDBOOK OF MINING LAWS.—Containing the U. S Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, $1.00. Sold by Dewey & Co., S. F.

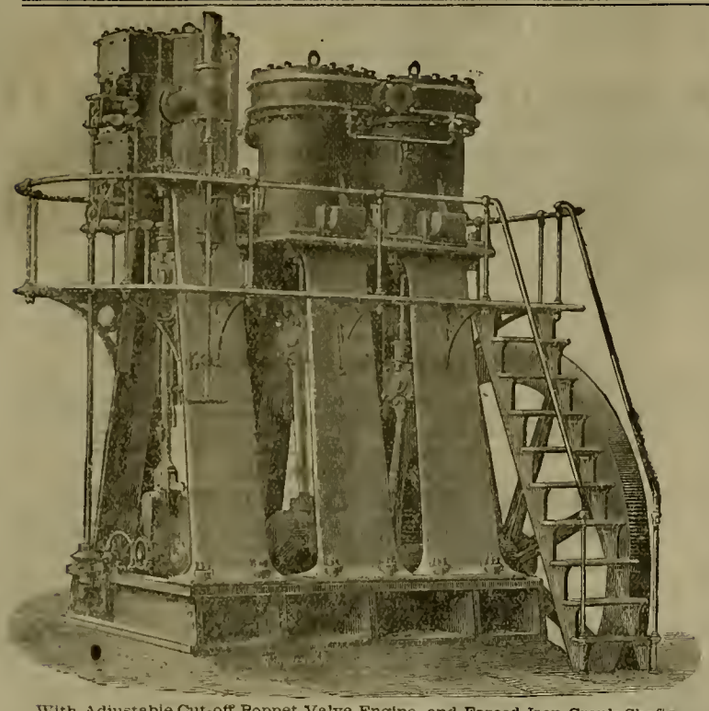
A New Edition.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Postpaid, $3.00. Sold by Dewey & Co., S. F.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and eather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.



With Adiustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absoluto certainty in tho action of the valves at any speed. Perfect delivery of tho air at any speed or pressure. Tho heating of the air entirely prevented at any pressure. Takes less water to cool tho air than any other Compressor.

Power applied to the best advantage. Access obtainable to all tho valves by removing air cheet covers. Entiro absence of springs or friction to open or shut tho valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensivo foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swazing, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of al U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid.

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia

March 10 1880.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

THE NEVADA OVAL TOP RETORT.

The advantage of this Retort over the OLD FLAT PATTERN is, that it can be filled full of Amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can be driven in or out of place by a single stroke of a hammer.

The Annoying Thumb Screw is Entirely done away with.

We Make Seven Sizes, as follows:

Number or Pints.....	1	2	3	4	5	6	10
Holds Pounds Quicksilver	12½	25	38	50	63	75	125
Weight each.....	10 lbs	15	18	25	31	44	65

Mortars and Pestles,

GROUND INSIDE.

Size—Quarts....	½	1	2	4	6	8	12	16
Hight—Inches..	37	5	6	7½	8½	9	11	12
Weight—Pounds	6½	9	16	22	37	43	72	86

Bullion Ladle.

Forged from one piece of Charcoal Iron, eight inches in diameter by four inches deep.

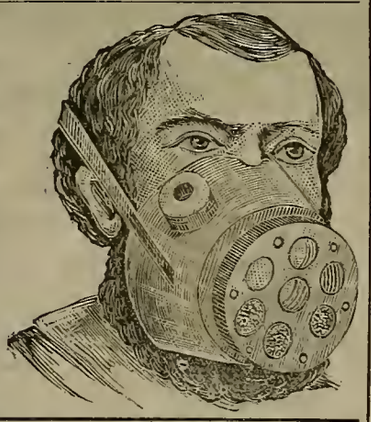
Send for Circulars and Prices.

DUNHAM, CARRIGAN & CO., Agents, San Francisco.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

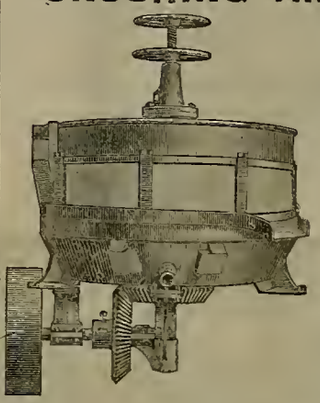
STEIGER & KERR'S

CONTINUOUS DISCHARGE

CRUSHING AND GRINDING PAN.



This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The pan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

SAN FRANCISCO, SATURDAY, JUNE 19, 1880.

VOLUME XL Number 25.

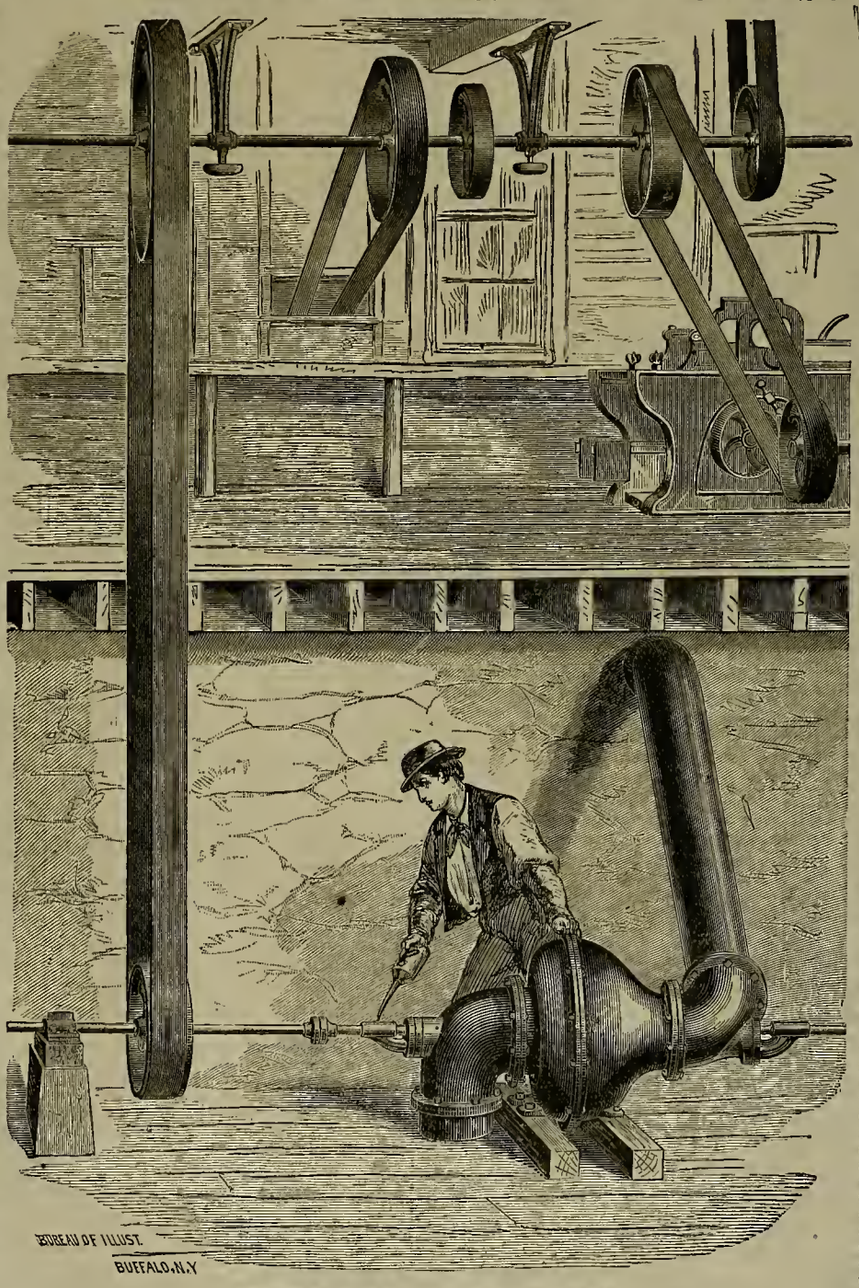
Morals of Silver and Gold Mining.

Mining for silver and gold has such undisputed antiquity, that by this time one would imagine it had acquired a well-defined status. Yet every now and then we find some one writing in defence of the industry in a half apologetic manner, and almost conceding that the business was a necessary evil. The use of silver and gold in some form is interwoven with the history of every people, and they will continue in use doubtless until the end of time. They have contributed so much to promote civilization that it seems doubtful whether it would exist in its present elevated form without their presence. The search for silver especially, and its mining and reduction, has been from the beginning a fine school of discipline. It is attended by such numerous obstacles that men have been taxed to the utmost of their power to overcome them. After one has found his vein and followed it into the depths, he is compelled to devise some new expedient to subdue the water which constantly threatens to flood his mine and destroy his labor. Having overcome this difficulty, he next finds himself unable to work for want of fresh air, and his highest ingenuity is brought to the task of supplying it. These and countless other difficulties which accompany mining and the separation of the metal, encouraged the study of the sciences, in order that the results obtained by observation and demonstration in the laboratory might be applied to the business.

Several of the most extensive engineering works connected with mining owe their existence to the search for silver. We need only mention a few that occur to us: The great tunnel for draining the Schomnitz mining district in Hungary was undertaken during the last century and is about nine miles long; the tunnel at the silver mines of Freiberg is eight or nine miles long; and the mining district around Clausthal is drained by a great tunnel—also begun in the present century and finished about 1835—some 12 miles long, which taps the mines about 1,000 ft. below the surface. These vast works were undertaken by government, and, considering the time and the conditions under which they were begun, they must be regarded as triumphs of engineering skill. And our own great Sutro tunnel, undertaken and carried through to the present day by private enterprise, is second to no engineering project of the time. It must be remembered that silver mining gave the impetus to these vast schemes.

Objection is made to gold and silver mining that the business is, now-a-days especially, associated with the stock exchange, and is in that way productive of evil. Many of the great and beneficent industries of every civilized community are obnoxious to the same objection. We all know, it is presumed, how railroads are built and manipulated. We have heard, it is supposed, of "corners" in wheat, by which not only the pockets of rich speculators were pinched, but likewise the stomachs of thousands of the innocent poor. But it would surely be a sorry reason for checking railroad enterprise or the growth of wheat because they were the occasional or habitual means of speculation. There is this to be said of speculation in mining shares—which leads, of course, like any other speculation to inflation and collapse and gain and loss—that it is not apparent how the stupendous mining operations on the Comstock could be prosecuted without the agency of the stock market. In fact, it may be said that there is no other practicable method of meeting the enormous assessments required. Under the present system, the mining share market impels the community through the instinct and hope of gain to a practical co-operation in the business of mining.

MINERALS IN MEXICAN GRANTS.—A large number of people still entertain the belief that the old Spanish or Mexican grants of agricultural or pasturage lands carried with them titles to all mineral land included within their boundaries. A notion has prevailed, too, that the U. S. Supreme Court decided in the memorable case of Fremont vs. the United States that such grants carried the mineral with them; whereas, the court did not pass upon the question in that case. The only question before the court then was the validity of the title, and whether there were any mines on the land, and if so, what were the rights of sovereignty in them, were questions to be discussed in another form of proceedings. This point, however, was decided, in 1862, in the case of the United States vs. Andres Castillero. The court decided that Spanish or Mexican titles to land for grazing or agriculture did not embrace a title to mineral land, and showed that not only Spain and Mexico, but most all nations of Europe and America, retained complete titles to all mines and minerals in lands granted for pasturage and agriculture.



IMPROVED HORIZONTAL MINING WHEEL.

LAST YEAR, says the Yankee Fork *Herald*, Idaho produced nearly $500,000 in bullion more than Arizona, about two-thirds as much as Montana, and about half as much as Utah. This estimate is made without reference to the ore shipped out of the Territory for reduction.

New Improved Horizontal Mining Wheel.

We give on this page an illustration of a comparatively new method in the application of turbines to mining purposes. For many years wheels have been located in horizontal positions, proper arrangements being made in each instance to suit the circumstances. The illustration gives a view of a new design and casing, a convenient modification of the "Patent Globe Case," which has been in use a number of years. The object attained in this new arrangement is economy of space and the application of an extremely small inlet and head-pipe, this latter being accomplished by a peculiar arrangement in the upper or interior part of the casing. The new design affects also a great saving of power, by means of the use of anti-friction bearings, which can be oiled, the whole being accessible and subject at any time to examination. The design is intended particularly for mining purposes and for small wheels under high heads, where the use of gears is not only difficult of arrangement and of keeping in order, but frequently impracticable otherwise.

The horizontal shaft of the water wheel on which is placed a pulley, affords not only the simplest, but the most efficient means of connecting the power to the point where it is desired to be used. This is easily effected, and any amount of power transmitted and motion obtained that may be desired, by properly proportioned pulleys, with light but sufficient belting. The method is not only applicable to mining purposes, but frequently may be attached to saw-mills and other machinery where a simple and efficient arrangement is desired. The improved horizontal wheel is admirably adapted for mining, pumping and other purposes, and where it is desired to have the greatest power in the least possible space, having the smallest conducting pipe that can be used and the simplest communication of the power to the work. The Pacific coast agents for this horizontal mining wheel are Messrs. Parke & Lacy, 21 and 23 Fremont St., S. F.

AN UNSETTLED QUESTION.—One important question to miners which has never been satisfactorily settled is, what constitutes $100 worth of labor and improvements? We often hear of trouble resulting from claims being jumped by parties who hold that the necessary amount of work required by the U. S. statutes has not been done in the manner prescribed by law. Some persons have expended annually $75 or $80 for actual labor and $20 or $25 for tools and other material, making the total of $100. The parties who have relocated such claims hold that actual labor to the value of $100 must be performed, independent of cost of material used, etc. The law on this point is not very definite and allows of a liberal construction. The following is the literal reading of the statutes: "On each claim located after the 10th day of May, 1872, and until a patent has been issued therefor, not less than $100 worth of labor shall be performed or improvements made during each year." This point as it now stands is liable to cause considerable litigation. The Commissioner of the General Land Office has never, to our knowledge, decided as to whether the money expended for powder, fuse, tools, etc., can be counted as part of the $100 worth of labor required. Until such decision is rendered, miners will have to be controlled by the by-laws of their own districts, each mining district being accorded the right to make regulations for its own government, not in conflict with the laws of the United States, or of the State or Territory in which the district is situated.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Tulare and Kern County Mining.

Editors Press:—Many of your readsrs will remember the White River mining excitement of 20 years ago and more, which caused a rush of proepectors to that part of the foothills of the Sierras that now lie on hoth sides of the houndary line hetween eastern Tulare and Kern Cos. For a time the White River mines were all the rage. Considerahle gold was taken from the placer mines along White river, Grizzly gulch, and other canyons, where sufficient water could he had. The largest nugget found was in a emall guloh in sight of what ie now White River P. O., or what was hetter known in early days as

"Tail Holt."

Thie nugget wae worth over $400. Long siuce, however, the general intereet in these mines died away, the prevailing impression heing that they were "worked out."

The regular rounds of your correspondent have lately taken him to this region, and the same fact was impressed upon his mind that he learned and expressed in your columns eome years since, when traveling up the Yuha river, through Downieville and Sierra City, viz: The frosts and rains of each winter are disintegrating our gold-hearing eoile and rocks, and washing them down into our canyons and gulches, thus euppIying the old placer mines again with gold. It seems, too, that in eome localities where these placer diggings are lcft undisturhed for several years, they almoet attain their formcr richness. Consequently when as wet a winter comes on as the last, euch placere can he and frequently are worked over with considerahle profit. This re-working of the placer mines of California and its henefits fall chiefly to the lot of our Chinese population, who are unquestionahly good miners, as they are first-class gardeners. In illustration of this fact, I am reliahly informed hy C .T. White, mining recorder of this district, that last winter, nuggets worth from $25 to $40 were found in White river, just hslow the postoffice, hy some Chinamen, while othere of them took from Fine Gold gulch, near hy, three nuggets, valned together at $50. Mr. White saye rich float ahounds in White river, as much so as in any stream in California. Yet most of the gold here is fine, rather than coarse.

No Systematic Mining

Hae heen done in this district of late years. Yet 20 yeare ago a large amount of mining was done here with arastras. Usually no shafts have heen sunk more than 10 to 30 feet, though 12 yeare ago one was put down 90 ft. There is running water in White river ahout 8 months each year. It heads only eome 12 miles ahove the poetoffice. From Mr. White I also learn the following facts: The ledges on Bald mountain, ahout two miles east of White River P. O., are well known. Along the surface of the main lead for three miles at eight different points, ore has heen lately taken that yields from $20 to $500 per ton. The gangne rock in the lower hills is slate, in the higher ones granite. Claims can he hought along this ledge for $1,500 to $2,000 now, whore the prohahle average yield would he $100 per ton. Any one wishing further particulars ahout these and several promising new ledgee, can gain the desired information from Mr. White at the office ahove named. He helieves a little ready capital is all that is needed to make good profits from these ledges. He asserts that monntains of gold-hearing gravel exist ahout Posa creek, Gordon's gulch, Rag gulch, and Willow springs. In prospecting, these pay all through them from ½ cent to 12½ cents per pan. All that is needed to get good profits hy working them is water enough for the hydraulic process. Enough can he hrought for this purpose hy a ditch 25 miles long from the north fork of the Kern river. Or at a distance of 10 miles on heade of Deer creek and White river plenty of water can he had for six months of the year.

The gold-hearing ledges on Bald mountain vary from one inch to six feet in width. As you go down on them some "pinch out," othere widen. Few have heen examined to auy depth.

An Odd and Very Promising Ledge

Of dieintegrated and decomposed gold-bearing quartz, was found last year hy Thos. Williams and partners. It is located on the southern elope and near the top of what they now call Bowlder hill. This hill is a prominent point among the foothills about five miles southeast of White River P. O. It is immediately north of Blue mountain, and separated from that ridge hy Grizzly gulch. The rough hill, eparsely covered with scrubby pines and oaks, is, in the main, a mass of huge granite houlders. Learning that much of the dirt around the ledge yielded $4 in gold to the pan of dirt, your correspondent wished to examine it, and made his way to it on horsehack over the narroweet and most rugged of traile, and across ridges without trails. There, after a rough, wearisome climh, he found Thos. Williame and W. H. Popple, present owners, and Wash. Williams, one of the first discoverers, finishing a horse arastra that was to hegin work next day on 40 or 50 tons of finely-hroken, reddish quartz, like rosin mixed and set in a whitish cement. An odd feature is that all of thie, whether quartz, or clay, or decomposed granite, whsn crushed and washed in a minsr's horn, shows a large psrcentage of fine, pure gold. It is estimated that this ore will average from $50 to $100 per ton. These men first located the ledge in June, 1879. Thsy found evideuces of prospecting nsar it that was prohahly done as long ago as 1857. They named the first ledge found Vulture, hut are now working on its southeru extension. Here they have a tnnnel 140 ft. in. Throughout thie distance the ledge proves to he from 8 to 30 inches wide.

A Geological Description

Of this ledge and its surroundings hy Oliver Cox is in suhstance as follows: The period of formation is Jurassic. It contains gold commhined with hisulphide of iron, hematite and hydrous oxide of iron, with traces of galena. Associated with these are talc, porphyry, kaolinite and feldspar. It is encased in much semi-decomposed granite. The surrounding rocks are granite with porphyry dikes, greatly disturhed, evidently hy earthquakes and other volcanic action. A percentage of silver in the gold makes its valne $14 per ounce. Placer gold around the ledge in the debris carried down in the Pliocene period.

Mr. Williams informed me that the water for their arastra will he supplied from a shaft eunk 40 ft. deep on the ledge ahout 200 ft. above the arastra, which is near the mouth of tho tunnel. Wator will he brought out hy lead syphons and pipe.

Ledge rune nearly north and south and dips east hetween 30° and 40°. It is in the northern edge of Kern county. The tunnel and arastra are from 800 to 1,000 ft. ahove the hed of Grizzly gulch. The hight ahove eea level is, perhaps, not far from 2,500 ft. The view of San Joaquin valley, with Tulare, Buena Vista and Kern lakes, and the Coast range in the distance, is very fine on a clear day. We may reasonahly expect to hear a good account from this uew mine. I have heen shown hy Charles Winkler, former engineer in the Sumner miue, at Keruville, specimens of a very finely grained clay, not unlike kaolin, or more like ocher, in that quite a variety of distinct colors is found in the same ledge. These colors are hright red, like cinnahar, yellow, lilac, hluish and white. A emooth surfacc when dry, has a glossy look and smooth feeliug like soapstone. It hes heen tried for paints, and found to work well. Can it not he utilized in the manufacture of paints? So large is the ledge, it can furnish many thousand tons. It is fouud upon the hlnffs of Kern river eome 15 miles from Sumner on the S. P. R. R. Any one wanting farther information ahout it, can inquire of Mr. Winkler at Bakersfield. J. W. A. W.

Kern Co., June 4th.

Silver in Shasta County.

Editors Press:—Thcre are wonderful things in the country as well as in the city. People raised in the city are as awe-struck hy what they see in the monntains as our country cousins are hy what they see in the city, and our country cousins enjoy our exhibitions of verdancy as much as we do theirs when we see tbem "gawking" at ohjects familiar to us in the city. Upon the whole they have us rather at a disadvantage. Our wonders are artificial, theirs are natural. It is easy to understand and comprehend art, but nature is inscrutahle. Dnring our trip hy private conveyence, through the valley to the mountains, a distance of 300 miles or more, good crops and juhilant farmers were found everywhere. The ahundance of the wheat crop is simply wonderful. Heretofore when the fields promissd ahundance, the farmers would fret and worry hecause the abnndance of the crop hespoke hard work and low rates, or a meager crop high rates. The firet promised hard work and little pay, the latter moderate compeusation and less work—the latter to he preferred; hut now they all seem willing to work, expecting fair prices.

Sacramento county will grow larger crops and more of it than any year previous; even the red hill land has an ahundant yield. Placer, Yuha and Butte, alwa's celehrated for their great yields in their rich river hottoms, will reach far ahead of any previoue year. Tehama will he no exception to the general rule, and Shasta, where more water falls than perhaps any other county of the State, wherever there is arahle land, will do her full duty.

The mines never looked more promising, and old gruff prospectors who heretofore would sit down and growl that the Chinese have taken possession of the country, are now scratching their sleepy eyes and are talkiug quartz, leads, silver, gold, porphyry, slate, and even are heginning to know more than the experts. A new era is dawning on our mining regions. Where heretofore they expected to fiud ouly placer diggings, is now fonnd the most valuahle quartz ledges, and where only gold was expected, rich silver mines are found.

At this particular time and in this part of Shasta county the silver hoom is up high, and such expressions as the "most extensive, richest and most valuable silver ledge the world has ever seen" are frequent.

Some five or six miles from the ancient and dilapidated town of Shasta, was known to exist what was called the Iron mountain. Nothing was expected of it, and no one prospected thsre. A curious expert came from tho city and has heen secretly looking at its formations, assays have besn made of his finds and now the whole country is wild and claims are staked off for miles. A new silver belt has heen discovered, the assays of which go away up into the hundreds. The mountain is inhabited and the sleepy miners are all awake and alive to ths new interest. I will soon visit it myself, and when I have tested its quality will give yon the rssult of my investigations.

A. Myers.

Whiskytown, Shasta Co., June 3, 1880.

Meadow Lake District.

Editors Press:—We have heen ramhling and have fallen, or rather stumhled upon the old, aoandoned and much ahused Meadow Lake mining district. Although at one time there were thousands of people in this district, for years it has lain unnoticed, except when some venturesome individual has pitted his intelligence throngh means of some complicated process against its rehellions ores. Now, however, indications are favorahle for a revival of the old camps thereahouts, as it has heen practically demonstrated that the ores are not only rich, hut can he cheaply worked. Realizing this fact, the

Cieco Con. Gold Mining Co.

Have eecured hy location and purchase the following named claims, each containing 1,500 linear ft.: the Badger, Riddle, Blackhawk, Charlick, Last Chance, Cisco, Reynolds and Keystone, all of which, except the Keystone, are situated on Red mountain. The Keystone was formerly called the Eclipse, and ie situated near Meadow Lake, while the others are from three to five miles from the lake, hut show the eame character of ore and country rock.

This company is incorporated under the laws of the State of New York, with a capital stock of $10,000,000 divided into 100,000 ehares.

They have heen and are still engaged in working the Badger claim. They have reached the ledge hy means of a tunnel, and have crosscut it for a distance of 34 feet, all good ore, and at present have uo indications of reaching the foot wall. The ehaft they are now sinking is down 70 ft. in ore all the way, hut no crosscuts have heen run to determine the width of the ledge. The first 15 aseays made from the croppings and working level, averaged a little over $290 per ton, some of it running as high as $690.

Machinery has heen ordered from the East to work the ore, of which they have a vast amount on the dump, and it is expected to arrive daily. When it does the mill will he erected as speedily as possihle, and ere long we shall douhtless hear of the payment of dividends hy this company.

Across Red Mountain

From thè Cisco Con. Co.'s works we reach the U. S. Grant mine. The mill of tbie company, which was crnshed hy a snowelide in April, ie heing repaired, and as soon as it is in running order the music of its stamps will be heard. They have an eight-ft. ledge giving eplendid assays.

The Gazelle Mining Co.,

Owning an extension of the Grant location, are developing their property, and have great confidence in its future value. The ledge where they are working is ahout 30 ft. wide and givee good assays.

Other mine ownere are waiting for the ground to dry out a little more hefore commencing work, and hefore next fall there will he many mines hrought to pnhlic notice on their actual merits that have heen unnoticed for years.

A. B. C.

Truckee, Cal., June 7, 1880.

Chinese Steel.—A considerahle steel-making industry exists in the present day in China, on the Upper Yangtze, wbence the eteel ie sent to Tient-sin for shipment and distrihution. It fetchee much higher prices than the Swedish steel imported into the country. The Chinese metallnrgists recognize three kinds of steel—namely, that which is produced hy adding unwrought to wrought iron while the mass is suhject to the action of fire; pure iron many times eubjected to hre; and native steel, which is produced in the southwest. The different namee for steel are twan kang, or hall steel, from its rounded form; kwan kang, or sprinkled eteel; wei tee, or false eteel. The Chinese, apparently have known how to manufacture steel from the very earliest ages, and in the time of the Hau dynasty ironmasters were appointed in several districts of the old Leangchou to superintend the ironworks.

A Paper-Mill Project.—The Los Angeles *Express* advocatee the starting of a paper mill in that city, and enumerates many advantages existing there, such as plenty of pure water—an essential in paper-making; a fair article of coal from adjacent mines, which can he delivered at $6 per ton; an ahundance of straw, to he had at nominal rates; great quantities of rags and waste, now ehipped to San Franciseo at a meager profit; and plenty of idle capital and unemployed lahor. The most important advantage mentioned, however, is the fact that a fiher of a cactus, which growe in ahundance on the Mohave deeert (accessihle hy rail), has heen demonstrated to make an excellent pulp for white paper. These are certainly good reasous why such an enterprise ehould he considered, and, under the proper auspices, capital from San Francisco might possihly he enlisted in it.

Sensible Advice.

One good corrsspondent, who wonld faithfully and psrsistantly present the claims of sach mining camp to the Eastern capital that lies hoarded up, and to the Eastern intelligence that is quick to catch all the advantages, and ou the alsrt to avail itself of opportunitiss for profitahle investment, would hs of incalculahle valus to the mining indnstry of this country. The people of the East are eagerly ecanning the mining field, every avenue of information is hesieged for news. The papers here devoted to tbe mining interest are glad to pnblish facts from any great mining field. The people hcre care nothing for ramhling, windy letters from the professional correspondent who knows nothing of what he writes except the business coaches of the deadheading railroad and the accommodations of the advertising hotels. They want the facts written rather hy the clumsy hand that has wrung the pick all day in the mine, or hy the man who has personal or practical knowledge of the country, and the minerale of which he writes. There are thousands of dollars to-day in many Eastern citiee that would go into the development of a mine at once if one-half of the certain advantages which hundreds of localitiee possess would he made known and substantiated. Hundreds of rich mining camps are slowly dying out or harely clinging to the ragged edge of exietence for the want of capital that would hasten to vitalize and fill them with prosperous activity, if their real value and promise were only presented in a light that would attract and hold the attention of thousands seeking favorable opportunities for investment. There seems to he a feeling in eome portions of the mining country that the times aro hard and capital is slow to reepond. The facts are that there prohably never was greater activity manifested in every line of industry in the East than at present. There never was a time when so much hoarded capital was seeking the channels of husiness, and never a time when so much favorahle consideration has heen given to mining investments hy the husiness men of the country. It doee not matter how valuable and rich the prospecte and mines of any locality may he, if the facts of its existence is not known. The advantage to a district and the certainty of success depend largely upon the amount of knowledge disseminated concerning it, and the attention it has heen ahle to attract. Many rich and promising districts are lauguishing for capital. Capital is rusting in crowded vaults hecause an opening has not heen presentcd. Let a liue of communioation he opened up hetween them, and a mutual henefit will he the immediate result. Miners, write of your prospect holes, write of your mines, write of your district, write of your State, of the minerals, of the rock, of the assays, of the depth, of the value, of the improvements, of your needs, of anything that will he of interest to those who are anxious to learn the exact condition and promise of your district. Men, money, mills, mails and towns will come rapidly to those places which keep their advantages hefore the puhlic. Let your light shine.—*Mammoth Herald.*

Capital and Commerce.—What are the forces that keep thousands from starving in England to-day? Are they not the forces of capital and commerce? Who are the men that thne feed the hungry? Are they only the philanthropists, the reformers, the advocates of this or that panacea for the ills that affiict humanity! Far from it. They are the Garretts, the Scotts and the Vanderhilts, the Cunards, the Allane and the Leylands, and all the less-known memhers of the unlearned profession, who, perhaps aware of, or more or less ignorant of, their true function, are yet the agente hy whose work natione are sustained. No henevolence, no almegiving, could possihly reach the need; and if it could, it would pauperize those who received, and ruin those who gave—it would work hoth moral, mental and material degradation. It is hy the use of capital that the vast crope of the great West are produced; it is hy the nse of capital that they are moved; and it is the work of commerce, condncted hy husinese men seeking woalth for themselves only, that distrihutes the vast stores over wider and wider areas, and thus renders the struggle for exietence less arduoue for each eucceeding generation of men. We are more nearly a nation of shop-keepers than any other, and we may well be thankful for the distinction.—*Atlantic Monthly for June.*

Swelling Clays.—A great nuisance iu mining on the Cometock are the swelling clays that are occasionally encountered. They move in all directions. Often they rise np from the hottom of a drift or tunnel and displace the track. Cut down the clay and level the track, and it is hut a short time hefore the same work must again he done. In a tunnel in American Flat au account was kept of the different cnttings, and it was found that over 30 feet was cut off hefore it ceased to rise. In places along the Sutro tunnel this epecies of clay is giving a good deal of trouhle; the same is also the case in the Union ehaft. The clay may either rise up from the hottom of the drift or push its way in ou one or hoth sides. Some have compared the creeping of this epecies of clay to the motion of a glacier, hut it ie more like the swelling out of a piece of some pithy or spongy substance that has heen suhjected to powerful pressure. All that can he done is to keep cutting it away as long as it crawle out and gives trouhle, until it has lost its elasticity or the power hehind can no longer force it forward.—*Territorial Enterprise.*

MECHANICAL PROGRESS.

Tempering Steel.

Twn nf the most important processes in blacksmithing are the hardening mid tempering of steel. Great judgment particularly, as well as experience, is required to temper dies and tools. With good judgment, a person will soon learn to temper; and without judgment, tempering can never be successfully learned. A man may learn to do one special kind of work, but put him in a large manufacturing establishment, where all kinds nf dies and tools are used, with hardly any two requiring the same temper; and without judgment, the difficulties connected with such a position can never be overcome.

To harden and temper a piece of steel, it should always be properly annealed; otherwise it is almost certain to spring or warp. It is a very general idea that you can draw all the temper out of steel, without heating it red hot all over; but such is not the case. Heating the face of a die and covering it up in ashes does not thoroughly anneal it by no means. Possibly in that way you can get it in such a condition that it can be worked; but it will not be very soft, and will not harden and temper as well as if it had been heated all over.

The best way to anneal steel (when you do not have a kiln for that purpose) is to heat it all over in a slow charcoal fire; the slower it is heated the better. Do not heat very hot, but all over and all through. Then take it out and cover it up in fine charcoal, and let it remain till cold.

In heating a die for the purpose of hardening, it is not necessary to heat it all over, unless you want to harden it all over. The only way, in my judgment, that dies can be tempered as they should be, is for the one that tempers them to see, from time to time, how they work, as they are being used; and in that way he can tell if they require more or less temper and the particular places where they should be hard or soft.

It is useless for any one to undertake to tell how to temper anything that is used in a manufacturing establishment; such knowledge can only be acquired by experience, combined with good judgment and mechanical ingenuity. I will try, however, to explain my way of hardening and tempering.

Trip-hammer dies may seem very easy to handle, but a blacksmith without experience would meet with many difficulties. Take, for instance, a die seven or eight inches long, one and a half inches thick and four and a half inches wide with several impressions cut in it, leaving several small points which are liable to fly off as soon as they are hardened or when you are drawing the temper. Now, my way to prevent the corners from coming off, and keep the dies straight is this: I heat my die very carefully in a clean charcoal fire, being careful not to get it any hotter than is necessary to have it harden. When the proper heat has been obtained, grasp it with the tongs near one end in such a way that it can be put in the water perpendicularly, and while in the water I turn it to a horizontal position and take it about halfway out, letting it remain until it is cool enough on the face to take out entirely for an instant without permitting the temper to run down. Then I withdraw it and return it to the water several times very quickly, until it is cool enough to take out and scour off. The temper can then be drawn to suit, without any danger of the corners flying off.

The object in putting it in the water perpendicularly is to keep it straight; and, as it cools off all alike, when you bring the back out of the water the heat rushes up towards the back, and expands it, taking all the stianie off the face of the die and preventing it from breaking.

By plunging it into the water and withdrawing it very quickly, the face of the die has time to get cool gradually, and the corners are thus prevented from flying off.

This process will work well on any dies or tools hardened in this way. I have tried it hundreds of times with the best success.—*Cor. Blacksmith and Wheelwright.*

Effect of Use Upon the Quality of Iron. In the summer of 1878 Prof. Banschinger superintended some repairs upon a chain bridge which had been built in 1829. He examined several of the links by various tests, and found that there was no evidence of any diminution in the strength of the iron, nor of any change in its structure or its elasticity during the use of nearly half a century to which it had been subjected. In 1852 von Pauli tested several bars for another bridge, which was repaired in 1878, when Bauschinger subjected some of the same bars to new tests. He found that the mean strength was still the same, after 25 years' use, and that no change of structure appeared to have occurred since the time of von Pauli's original tests.—*Dingler's Journal.*

Spectacles by Machinery.—It is said that there is but one establishment in this country for the manufacture of spectacles by machinery, and that is located at Reading, Pa. The glasses are not only ground by ingenious machinery run by steam power, but the frames and all the processes needed to complete the spectacles are wrought by mechanism.

Making Riveted Sheet and Plate Iron Pipes by Machinery.

Machinery for the production nf finished tubes or pipes made of sheet or plate iron is now in successful operation. The sheets nr plates nrs first cut or rolled into strips nf suitable width, a machine then rivets or welds them together, forming a continuous length; thus prepared, they are fed into another machine, which forms, punches and rivets them, delivering a finished tube in one piece, the length of which may hs extended indefinitely and sawed off as required. In pipe or tnbes made by this process the seam takes n spiral form—uniform interior diameter, being secured by an offset on the outside edge of the strip eqnal to the thickness of the sheet or plate used. Senms thus constructed are superior in strength to the body nf the iron, and add greatly to the rigidity of the pipe, which also has the advantage of the tonsile, instead of the transverse strength of the sheet, for which reasons a tube made of ¼-inch iron, with a spirnl seam, would resist as great a bnrsting etrain as one made of soant ⅜-inch iron with a straight seam, thus effecting a saving of over one-third in the material employed. Recognized engineering authorities give the strength of a longitudinally riveted soam to be only about 55% of the strength of the iron of which it is made.

Recent tests of spiral seam pipe, made up of galvanized sheet iron and regalvanized after formation, gave, upon a Belfield gauge, the following extraordinary hursting pressures :

12-inch	pipe of	No. 16	gauge iron	450	lbs.	per square.
8	"	" 18	"	490	"	"
6	"	" 18	"	650	"	"
4	"	" 20	"	750	"	"
3	"	" 20	"	900	"	"

As yet no heavier iron than No. 12 wire gange has been used, hut experiments having proved the applicability of this system of manufacture to the construction of pipes for hydraulic engineering, boiler shells and flues, and other cylindrical strnctures for purposes demanding heavy pressures, provision is being made for extending the production in that direction, the chief advantages being the saving of expense over hand labor, the better quality of work produced and the economy in material. The lighter kinds of the spiral pipe are attaining a very general use for leaders, ventilating shafts, blown and suction fan connections, furnace pipe, smoke stacks and a great variety of uses in connection with house construction.

Pernot Steel.—A correspondent in Johnstown writes as follows: Pernot steel, until lately, has been known in this country only hy name, hut its manufacture has been commenced this year, on a large scale, at Johnstown, Penn. As is well known, the Siemens gas regenerators have been utilized for making open-hearth or Siemens-Martin steel, and also for melting crucible steel, but their application to this new improvement threatens to supersede hoth grades. The quality is fully equal if not superior to crucible steel for most purposes for which that has been used, and the expense of manufacturing decidedly less. In each furnace is a pan that can contain 20 tons of steel, which is revolved by a connection with the engine employed for that purpose. After the pan is charged, the gas flames playing over and around it hring the contsnts to the desired state of fusion, while the revolving of the pan causes the most intimate intermixture of the ingredients; thus overcoming the objection to melting steel in larger receptacles than crucibles. The operation is completed in a little more than five hours. The only concern that furnishes merchant steel made hy this process in the United States, is the Gautier Steel Co. Limited. They are preparing to furnish 40,000 tons per annum of this grade, which will be almost entirely additional to their present production.—*American Manufacturer, Philadelphia.*

Spence's Metallic Compound for Pipe Joints.—In our issue of April 3d some allusion was made to the new metallic compound, known as Spence's metal, and the various important uses to which it seemed applicable. Among others it was said to be peculiarly applicable for making joints in water and gas mains. According to the London *Journal of Gas Lighting*, it appears that subsequent experiments and observations go to show that owing to the hrittle nature of the metal and its rapid cooling, it will be inapplicable for such purpose. Still there are many uses to which this new compound may be put, which will nndoubtedly aecure for it a large commercial value and very general use in the arts.

An improved foundry ladle is described hy *Engineer*, hy the use of which, it is claimed, the production of clean castings is considerably facilitated. The ladles are made of wrought-iron, and have at their side, near the bottom, an opening which permits the iron to enter a lip riveted along the side of the ladle. The probability of any surface scoriæ getting into the mold is thus prevented.

To Discover Flaws in Shafts or Defects in Welds.—The *Blacksmith and Wheelwright* in referring to this subject says that if a piece of iron appears to have an unsound weld, or if it has a crack apparent upon the surface and it is desired to know how deep it penetrates, heat the part to he tested to a red heat and pour a fine stream of water upon the faulty spot, hut mainly on one side of it, and the iron on that side will lose its redness more rapidly than the other side, and plainly indicate how deeply the defect extends.

SCIENTIFIC PROGRESS.

The Milky Sea—Character of the Phenomenon.

Ths phenomenon of a milky sen has been known to occur in certain parts, hnt has not been very thoroughly scrutinized. Soms havs cnnsidered the luminous appenrancs in question an electric effect in thunderstorms; othsrs havs attributed it to cadavaric decomposition of marins animal and plnnts; others to abundant spawn, with fishes moving ahout in it. But ths truth appears to be that it resnlts from an accumulation of nnimalculæ capable of becoming phosphorescent, spontaneously or by friction. Some interesting information on the subject, (of nn exact character) has been recently published hy Liout. Poornaim, of the Freuch iron-clad *L'Armide*, which in February met with a milky sea in the passage from Point de Galla to Aden. The nights of Febrnary 9, 10, 12 and 13 were characterized hy the phenomenon in all its splendor, the ship during this time traversing 660 miles (1,100 kilometers) in a mean latitude of 12° north hetween the meridians of 61° and 51° east longitude. There was no thnnderstorm, the sky was clear, the moon new, the barometer, the thermometer and hydrometer were regular, and a gentle northeast monsoon was blowing. The temperature of the surface of the water was constant at 25°. The sea was like a snow-covered field in a clear night, and all trace of nndnlations was lost sight of. The milky look was hardly disturbed hy the motion of the ship and working of the screw (which shows that the layer had considerable thickness. By day all disappeared; hnt the hue of the sea was somewhat altered. Looked at attentively over the ship's side at night the water was seen to contain an enormous numher of luminous particles pressed closely together, and more brilliant close to the side where disturhed. Some 400 of these corpuscles, one or two centimeters long, conld be connted in a bucket holding 10 liters of the water. Drawn out, these were seen to he of gelatinous snhstance, which dried quickly and disappeared, leaving a dark glohule one millimeter in diameter, which, in the microscope, presented a transparent ovoid animalcule filled with eggs, and moving its fins and tentacles incessantly. A drop of water added to the dark glubule brought back its luminosity, and when the creature was bruised in the hand it gave a bright mark which was quickly extinguished and which had no smell. The milky water kept till day and looked at in the dark, showed no luminosity even though agitated; nor does the water procured hy day and hronght into darkness. It remains to be determined what causes the luminosity of these animalculæ, and the information is also desirable as to the position of the various milky seas on the globe, the times of their appearance, whether they persist or not in the same place, etc. Several of the officers on board *L'Armide* had witnessed the phenomenon hefore, hut never so brilliant or continuous. The *L'Armide*, in going out, had passed 30 leagues further north in Feh., 1878, without encountering anything of the kind.—*London Times.*

Premium for Scientific Research.

Uriah A. Boyden, Esq., of Boston, Mass., has deposited with the managers of the Franklin Institnte of Philadelphia, the sum of $1,000 to he awarded as a premium to "Any resident of North America who shall determine hy experiment whether all rays of light, and other physical phonomena, are or are not transmitted with the same velocity."

Among the conditions is the reqnirement that each competitor must transmit to the Secretary of the Franklin Institute a memoir, describing in detail the apparatus, the mode of experimenting, and the results; and all memoirs received hy him before the first day of January, 1881, will, as soon as possihle after that date, be transmitted to the Committee of Judges.

The Board of Managers of the Institute shall, before the first day of January, 1882, select three citizens of the United States, of competent scientific ability, to whom the memoirs shall be referred; and the said Judges shall examine the memoirs and report to the Franklin Institute whether, in their opinion, and, if so, which of their memoirs is worthy of the premium. And, on their report, the Institute shall decide whether the premium shall be awarded as recommended hy the Judges.

Every memoir shall be anonymous, but shall contain some sign hy which it can he recognized and designated, and shall be accompanied by a sealed envelope, endorsed on outside with same sign, and containing the name nnd address of the author of the memoir. The memoirs presented for the premium shall become the property of the Franklin Institnte, and shall be published as it may direct.

Effects of Heat on Granites.—Mr. Hiram A. Cutting, State Geologist, of Vermont, has been testing the capacity of different sorts of granite to withstand heat. He tested 22 specimens of the best known quarries, and found thnt while all were unaffected hy 500° Fah., damage usually began at 600°, was serious and frequent at 800°, and at 1,000° all the specimens were ruined, the stone from Mount Desert standing the test perhaps hetter than any other. He gives it as his opinion that the effect of water on heated granite is rather apparent than real.

Where Does Coal Oil Come From?

This is one of the qnestions that has long agitated the scientific world, and npon the answer to it more depends than seems to at first sight. If we know its source we can fairly determins as to the naturs and extent of ths supplies, and as to where to look for them. Ths *Scientific American* says: Some have thought that the oils have been produced by a slow distillation dnring the process of coal formation. A fatal objection, however, to this theory is found in ths fact that Great Britain, which has immense coal beds, contains nothing of ths kind, though suppesed traces have been found here and there.

The silurian and devonian rocks, which contnin the sources of most of the oil wells now in existence, have great quantities of fossil remains, and this has suggested the theory that the oils have resulted from their decomposition.

Prof. Mendeljeff thinks that on the first formatinn of the earth vast reservoirs of inorganic iron and carbon existed in the interior of the glohe. These were reached by the water condensing on the newly formed land and percolating beneath its surface. The heat decomposed the water into its component parts, oxygen and hydrogen, the first forming with the iron oxide of iron, the latter with the carbon petrolenm and other hydro-carbons. If this theory he the correct one, there still exist in the center of the earth reservoirs of petroleum that are to the sources as yet known as the ocean is to the spring, whose waters finally find a resting place in its hosom.

Dr. T. Sterry Hunt, of Massachnsetts, propounded in 1861 a theory to which he still adheres. He thinks that many of the animated beings of early ages were half vegetahle, half animal, and that the decomposition of their tissues produced what is known as mineral oil. Certain magnetic oliferous limestones have been found to contain 4½% of their bulk of petrolenm. A square mile of these 35 ft. thick would yield nearly 8,000,000 harrels, and as the area of these rocks is very great, they may contain supplies calculated to last an indefinite period of time. The subject is one well worthy the attention of all interested in oil wells.

Compression of Gaseous Mixtures.—If five volumes of carbonic acid and one volume of air are compressed in a proper apparatus the carbonic acid readily liquefies. If the pressure is carried to 150 or 200 atmospheres the meniscns of liqnefied acid is gradually effaced, and the liquid finally disappears. The tube then appears filled with a homogeneous matter, which resists all frther compression, as a liquid would do. If the pressure is then gradually diminished the liquid suddenly reappears, at a pressure which is constant for fixed temperatures; a thick mist arises, vanishes in a moment, and marks the level of the liqnid which has reappeared. The phenomenon cannot he explained by the heat of compression, for the tuhe is plunged in water which keeps it at a constant temperature, and the compression is made slowly enough for the cooling to be always complete. Cailletet thinks that the gas and liquid are mutually dissolved, so as to form a homogeneous compound. He has extended the experiments to a pressure of 450 atmospheres without varying the result.—*Compt. Rend.*

A New Phenomenon of Magnetism.—It is well known that the ratio hetween the residual and the temporary magnetism of a har of steel enveloped hy a magnetizing coil diminishes as the har hecomes shorter and thicker. Ang. Kighi was led hy theoretical considerations to a conclusion which is opposed to the ordinar phenomena, hut which experience has confirmed in every particular. It is this: If we take bars of the same steel and of the same diameter, but of diminishing lengths, we finally reach a length which shows no magnetization, and with still smaller lengths we obtain a residual magnetism which is opposite to that of the coil.—*Comptes Rendus.*

Spontaneous Generation. — Bastian has again visited Paris in order to try to demonstrate his views with regard to spontaneous generation. Being unahle to come to any agreement with Pasteur as to the manner of conducting his experiments, he decided to return to London. But hefore setting out he described his operation in detail, and Pasteur asked him how he cleansed his retorts. He replied "by rinsing them with very pure water." Pasteur assured him that there were hacteria even in the purest water, and advised him to repeat his experiments after having heated all the apparatus thoroughly in the fire. Nothing has since heen heard of spontaneous generation—*Les Mondes.*

The New Metals—M. Delafontaine has been examining the supposed new metals, and in the *Comptes Rendus* of the Academie des Sciences, he expresses his helief that the earths ytterhia, decipia, and philippia are real additions to scienc; and he then states that he cannot receive the other alleged new elements, which depend upon ohservations of "ahsorption spectra," as genuine.

Science Award.—The French Academy of Sciences has awarded *an extraordinary prize* of 3,000 francs to Dr. William Crookes, in recognition of his distinguished services to science hy his stndies in molecular physics, and his contribution to our knowledge of the propertiea of radiant matter.

The Mining Share Market.

There has been little, if any, difference in the operations of the mining share market since our last publication. The activity in the Bodies continued for several days, but under the large sales prices were not maintained, and they gradually took a downward tendency, and at the close were weak and dnll. So far as the Comstocks are concerned, the market is quiet, hut firm; holders are evidently hopeful of the future. They are seemingly undisturbed by the antics of either hnll or hear.

There has been nothing of especial interest reported from the Comstock mines. There, as well as elsewhere, the attention of holders is turned towards the north end as the point whence good news will come first. The opening of the 2500 level of the Union is looked to with increasing interest.

Good reports continue to reach us from Bodie and Columhus districts. In the latter the developments in several mines—as the Northern Belle and Jackson—have drawn unusual attention, and led to considerahle activity in the mining shares.

Bullion Shipments.*

Since our last issue, we have noticed the following hullion shipments:

Paradise Valley, Jnne 7, $2,762.34; June 11, $4,517.79; California, June 11, $49,657; Northern Belle, June 9, $6,594.46; Contention, June 8, $8,013; Tombstone, June 8, $11,950.97; Star, Jnne 11, $1,764.63; Northern Belle, June 12, $10,605.60; to the Carson Mint, June 14, Paradise Valley, $1,500; Ontario, per Wells, Fargo & Co., Salt Lake City, June 11, $4,315.49; Barhee & Walker, per Wells, Fargo & Co., Salt Lake City, Jnne 11, $1,828.73; Richmond, June 12, $22,458.54; Grand Prize, for May, $23,388.93; Silver Reef, for May, $113,013.39; Alexander, for May, $26,414; Northern Belle, for May, $100,450.

*Desiring to make our list of Bullion Shipments as complete as possible, we will he thankful to receive from mining Superintendents and Secretaries notice of all hullion shipments from their respective mines.

THE Fresno *Expositor* tells of an important development in the Cartwright mine on King's creek, east of Fresno. A true fissure vein, carrying a four-foot ledge of rich ore, has been found,

The California State Mining Bureau.

On the 1st inst., Mr. Henry G. Hanks, the newly appointed State Mineralogist under the Wasson bill, passed at the last session of the Legislature, assumed charge of the California State Mining Bureau. This is a new department, organized under the act referred to, and is one which will he of practical service to the miners and metallurgists of the State. We have received from Mr. Hanks a circular giving a copy of the bill under which the Bureau was organized, hnt we have already published it in full. The circular states that the Bureau commences with a large and valuahle donation of ores, rocks, fossils, reports, books, etc., comprising the collections of the State Geological Society. A State museum of practical geology will be made a special feature of the Bureau, to which all contrihutions will he duly accredited, displayed and preserved. There will he a library of reference maintained hy the Bureau, in which works on mineralogy, geology, mining, metallurgy and kindred subjects will he collected, together with maps, reports, copies of district laws, etc. To the museum and reading room the puhlic will have access during seasonable hours.

There will be new and interesting matters constantly added, such as maps, reports, snrveys, etc., hesides a collection of all the ores, rocks, fossils, metallurgical products, huildstones, etc., of the Pacific coast, with models of machinery in use and newly invented, and a general collection of minerals and ores of other countries for reference. It is intended to include all that pertains to practical and legitimate mining.

Every article sent to the Bureau will become the property of the State, for the use of and henefit of the public, and will be carefully preserved. As it is desirahle to make the museum as instructive and attractive as possihle, the co-operation of the puhlic at large is wanted by the State Mineralogist. Packages may he addressed to the California State Mining Bureau, San Francisco, and sent hy Wells, Fargo & Co.'s Express, or hy railroad, or steamship lines, as slow freight.

THE Crater mine at Ophir, Placer county, has taken out over $53,000 in four months, and it is now said to be doing even hetter still. There are hetween 30 and 40 men employed there.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MAHONEY MINE.—*Ledger*, June 12: We are pleased to he ahle to state that the Mahoney Co. are going to start work forthwith. A 40-stamp mill is to he put up as speedily as possihle—within 90 days if practicable.

YELLOW JACKET.—A clean-up was made of a short run, and the yield amounted to $9 per ton—a gratifying result. Regular hoisting works are now in process of erection, the machinery of the Bonanza being moved to the Yellow Jacket. The shaft is being widened. Altogether there is a prospect for a good paying mine.

BROWN CO.—We are informed that work is to he commenced shortly on the Brown Co. claim, which is the extension of the Good Hope, Jackson.

ITEMS.—The big Volcano tunnel advanced 70 ft during May. The Amador Con. is looking better. The ledge grows wider and the rock increases in richness. The Iowa, helonging to A. Thihetts & Sons, is also improving, and the outlook for the future is all that could he wished for. They are paying off regularly every month.

IONE CITY.—*Dispatch*, Jnne 12: Mining is going on with renewed activity in the vicinity of the Kirkendall mine, and also at the copper mine.

CON. AMADOR.—Suttor Creek Cor. *Sentinel*, Juoe 8: The new shaft of the Con. Amador is progressing finely, the rock is improving in richness as depth is attained. The ledge is remarkably wide and enough rock is in sight to keep the mill crushing to its full capacity for years to come.

AMADOR KING.—We have reliahle information that the owners of the Amador King are in negotiation with San Francisco capitalists, and that satisfactory arrangements for the development of the mine will probably he made in a few days.

DIVIDEND-PAYING MINES.—*Ledger*, June 12: The dividend-paying mines of Amador are the Amador Con., of Sutter Creek, and the Empire, of Plymouth. The first named has never levied an assesement. It has paid 34 dividends, amounting to $317,500. The Empire has paid 17 dividends, amounting to $478,000.

BUTTE.

HENDRICKS MINE.—*Mercury*, June 11: At the Heudricks mine, in Morris ravine, rich pay dirt has been struck and work is being pushed ahead as fast as muscle and water can push it. The men are now at work near the south end of South Table mountain, near where George Rigshy formerly operatod. The gravel presents the same appearance of that at Cherokee, and is of the same richness.

POWERS MINE.—Across the river O. P. Powers is piping away at the bank day and night. His last clean-up yielded him about one-third more than he expected. This mine has been paying so evenly for years past that it was easy to guess the value of the gold taken out each run. But a far richer streak or stratum was struck about a month ago, and the result is that it is one of the best pieces of property in the county.

MINING NOTES.—The mining interests of the county look brighter than ever hefore. Immense heds of gravel are only waiting for water to wash out the gold that is in them. And now a ditch capahle of carrying 3,000 inches of water is fast heing huilt, and thus the great want will he supplied in a great degree. Almost every day men with money—new men—arrive in town to look at the different pieces of mining property. The mines at Cherokee are paying hetter than for years past. How much of the kind of ground they are now in is uncertain, hut the company claim a large amount. Since the Davis ditch has become a reality, every foot of ground on Thompson's flat has become very valuahle and is located, some of it three claims deep.

A LITTLE BONANZA.—A friend stepped into our sanctum yesterday morning and ehowed us $1,200 worth of gold which he had taken out of a little quartz ledge in Mountain Spring township. The rock yields $8 per ton, and it only costs $1.50 per ton to work it. He does all the work himself and says he intends to stick to it. There are a vast number of just such ledges in the surrounding hills that should he taken up and worked.

SPRING VALLEY MINE.—*Record*, June 12: Supt. Waldever is anxious to continue his present run until July 1st hefore stopping to clean up. He is pushing ahead with energy in splendid gravel, and confidently expects to make a hetter showing than the mine has ever made.

CALAVERAS.

BOSTON MINE.—*Chronicle:* Developments at this mine, Buckeye gulch, continue wholly favorahle. In fact, the richness and extent of the vein are almost incredihle. The ledge is from 60 to 80 ft in width and contains strata of ore that will mill $100 per ton. In many instances the rock is absolutely hold together with threads and strings of gold. There are thousand of tons of ore in sight that glistens with free gold. Preparations for the erection of a 20-stamp mill are going briskly forward, and will he urged to a rapid completion as soon as the necessary lumher can he had. A fine hoarding house and lodging house have been huilt, and work is progressing energetically upon the mine.

EL DORADO.

GROSS MINE.—*Democrat*, Juuo 12: Everything in connection with this property, including recent clean-ups, is so satisfactory to the proprietors that they now propose, we understand, to add 40 stamps to the present battery, making 70 in all. As this conclusion must have heen arrived at after a thorough investigation of the deposit in sight, it is fair to presume that the original reports of its magnitude have not heen exaggerated.

INYO.

PIUTE DISTRICT.—*Independent*, June 12: The property hest know as the Johnson mine and mill, opposite Bishop creek, has heen worked some 2 or 3 months under the management of D. H. Sullivan, lessee. The mines consist of gold ledges known as the Golden Era, Tender, Buena Vista and Luella Nos. 1 and 2, and helong to Messrs. Sneden, Spencer and Bennett. Mr. Sullivan has heen running the 5-stamp mill and arastras, for a short time, under great difficulties and lack of steam for heating, hut has already shipped gold amounting to about $500. As the snow is clearing away he is putting on a larger force and following up his work with increased capital and experience.

MARIPOSA.

COE MINE.—Coulterville Cor. Mariposa *Gazette*, June 7: This mine is producing large quantities of gold. They have at present a 6 ft vein in the shaft that will pay from $40 to $50 to the ton. The shaft is down at present 45 ft helow the main tunnel. They can almost keep their 8-stamp mill constantly running from the rock taken from the shaft. They have just made a clean-up of $5,000 on a 10-day run of 8 stamps.

MINING NOTES.—The Martin & Walling will have water out of the mine and get to drifting this week. The Bandcrita is making 3 ft a day in its main tunnel. It is at present in about 90 ft. The Crown Lead mine will start up this week, beginning with a small force of men. The Cook Bros. were up 2 weeks ago looking at their large mining interest in this section. They are at present running a tunnel on the Potosi and sinking a shaft on the Malvena ledge.

MINES OF HORNITOS.—The recent sale of the No. 9 mine for a respectable amount has given an incentive to many claimants of mines to go to work and try the process of development hy actual work instead of the too much jawbone process.

ENTERPRISE MINE.—We hear favorahle reports from this mine, upon which a mill is contemplated and is probahly in the course of construction. This mine helongs to an

incorporated company. Since the big strike of late the stock, which could have been bought for 50 cents a share, is now held at $50 and $100.

Pool M. Co.—This company is reported to be doing well under the new Americanized arastra process. They have good pay rock. The only trouble heretofore was to save the gold, which is now claimed to be a success under the new process.

MONO.

Strike of Rich Gold Ore.—Mammoth City *Herald*, June 12: Yesterday morning a party of gentlemen went up to the south end of Mineral hill to look at a new and important discovery lately made by J. C. Brown and Peter Simmes in the Lisbon mine. A shaft has been sunk to a depth of about 30 ft, showing a ledge of 3 ft in width, in which free gold is plainly visible to the naked eye and very evenly distributed throughout the rock. The surface rock is similar to that found in other locations in the southern portion of this district.

Mammoth.—Tunnel No. 4 has been driven forward a distance of 35 ft in the header, giving a total length of 1,441 ft. In crosscut No. 2 a distance of 20 ft has been made, and they have not yet cut through the vein. Work was commenced in tunnel No. 3 during the fore part of the week, and the tunnel advanced 10 ft, making a total length of 930 ft. Work preparatory to breasting out ore has been commenced on this level at a point about 20 ft south of the Hardy winze. The ore body at this point is looking exceedingly well and gives good assays. Ore from this portion of the mine will be sent to the mill in 2 or 3 days.

H. L. & M. C. Joint Tunnel.—In consequence of the excessively hard character of the rock and the breaking of both drills, retarding the work for 1 day each, but 15 ft of headway has been made since our report of last Saturday. The total length of the tunnel is now 787 ft.

New Mill.—The Wales & Burke Con. mill has for the last 2 days been in successful operation. Although of but 4 stamps capacity, its crushings have exceeded the most sanguine expectations of the inventor. It is run by water power.

Laurel District.—The Fresno company is busy at work building houses and getting ready for their summer's work on the Convict, Queen and other mines of which they are owners. Work will be immediately commenced on the IXL mine in earnest. We are informed that a shaft will be sunk on the ledge to the depth of 60 ft, when a crosscut will be run to determine the strength of the rich body of ore already discovered on the surface. Other parties owning mines in the district, it is expected, will soon commence work.

Goodshaw.—*Free Press*, June 12: Another vein was cut yesterday in the east crosscut, 600 level, which last evening had been penetrated 2 ft, it resembled in appearance the Addenda and Oro ledges, being essentially silver-bearing rock. The Supt. will at once commence the erection of an ore house at the Goodshaw mine, and will commence to run drifts north and south on the rich ledge.

Standard Con.—Bodie *News*, June 12: The north drift from the east crosscut, 700 level, has been advanced since last report 10 ft, making a total of 105 ft. The north drift, 500 level, is in 20 ft. The south drift is in 28 ft, with no change to note in the appearance of the vein, which is about 6 ft wide. The north drift, 500 level (incline), has been extended during the past week 10 ft; total length, 100 ft. The vein at this point is 5 ft wide. The upraise on West Standard ledge is up 115 ft, showing a ledge 4 ft wide. During the week there has been no change in the appearance of the stopes.

University.—The east crosscut on the 510 level is now in 80 ft from the shaft, the face in iron-stained vein porphyry. Some very fine-looking seams of ore and clay are being cut, and the prospects are most favorable for soon cutting the ledge. In the west drift the ledge shows great improvement as advance is made south. The ledge continues to show a nearly solid body of fine milling ore, part of it being of a very high grade. This work will be continued to the company's lines, when ore stopes will be opened and the work of extracting ore for milling purposes commenced. The shaft is in fine condition for running cages, and the machinery at the surface is all in perfect working order.

NEVADA.

Planet Gravel Mine.—Grass Valley *Union*, June 10: The tunnel of this mine is in a distance of 2,400 ft, and has nearly reached the center of the channel, as is evidenced by the presence of coarse gold. The bottom of the channel is from 50 to 60 ft lower than the original grade of the tunnel, and has been reached by means of an incline and the aid of steam engine to do the pumping and run the cars. Now, that the depth of the channel has been ascertained, the tunnel is to be extended on its original regular grade, through the gravel, a distance of about 400 ft, to which point the engine will be removed, and a slope put down to the bottom of the channel

Items.—The Nevada City *Herald* learns that the Providence mining company will shortly erect an 80 stamp mill. A carload of machinery, belonging to the Cisco Con. mining company, passed through Truckee from New York, the other day, for the mine, which is located 2½ miles from Cisco.

Bessie Miller.—*Foothill Tidings*, June 12: This mine, near Washington, in this county, has been released from attachment and the property restored to Mrs. Miller, of this place. It is understood that Mrs. Miller has parties ready to put in money to fully develop the mine.

New Mining Ditch.—*Transcript*, June 10: A survey is being made for a ditch to extend from a point on Deer creek, near Scott's flat, to the reservoir of the Manzanita mine in Willow valley, a distance of about 6 miles. The construction of this ditch has been contemplated for some time, and it will, we understand, largely increase the value of the Manzanita claim by giving it an additional supply of free water.

PLUMAS.

The Emigrant Lead.—Plumas *National*, June 5: Smith & Davis, of Butterfly, have recently got a shaft to bedrock in their gravel deposit, and have discovered that they have a rich, coarse gold lead, and, they think, a continuation of the old Emigrant Hill lead. We were shown the gold which came from the bedrock in the bottom of the shaft, amounting to $10 or $12, and heavy, coarse channel gold. The depth of the shaft is 25 ft, and the ground is good from the top down. We are glad to record just such strikes, as it adds another item to the strong proof of the wealth of the section in which they are operating.

Argentine Quartz.—We were shown, the other evening, a chunk of retorted gold from the claim of the Thompson Bros., at Argentine. The piece was worth between $400 and $500, and was the result of a 10 days' run of their 5-stamp mill. They are said to have a large quantity of rock of the same quality, and although it is low grade they can mine it, and mill it in their water mill at a good profit. With larger milling facilities they would make a big business. The gold is very fine, and would sell to the merchants at $18 per ounce.

Notes.—The quartz mine discovered on Little Bear creek, last summer, promises to be valuable. The owners are running a couple of arastras, and making them pay liberally. The quartz is white, and the gold mostly in the seams, but it is plentiful when you do find it. Considerable prospecting is going on in Plumas now.

Spanish Peak.—*National*, June 12: Report comes to us that a splendid strike of blue gravel was made in the Spanish Peak tunnel, now being run by the Chicago company, one day this week. The gravel looks well, and, what is better, prospects at the rate of 5 cents to the pan. The managers are highly pleased, as they have every indication of a monster blue gravel mine, and if their anticipations are realized, their Chicago stockholders will be receiving dividends before the season is over. They are working a force of about 20 men and are pushing the work along rapidly.

Items.—Greves & Co. have struck a streak of blue gravel in their Blackhawk claims, and are in high spirits over it. Mr. Oeo. Cornell now has charge of the Indian Valley mine, and has put on a force of men. The probabilities are strong that a few months will show the mine to be one of the best in the Greenville section.

SAN BERNARDINO.

Cottonwood District.—Colton *Semi-Tropic*, June 12: From a party of prospectors just returned from the mining region north of us, we learn that the Alabama mine, which they located, yields ore which assays from $20 to $1,100 in gold and silver per ton.

Hunkey Mine.—They also bring ore samples from the Hunkey lead, in Mineral hill, which is situated about 600 ft above the Alabama, and running in the same general direction. This lead is 7 ft wide, with immense chimneys jutting out all along its course. The rock assays from $40 to $90 per ton, with 50% more silver than gold.

Rich Gold Ore.—The party brought from Gold hill, 00 miles from Colton, on the road to Panamint, specimens which are full of free gold. The finest specimen, however, is from the Blue Jacket lead, 5 miles from Rogers station on the Mohave river. This ore assays from $125 to $4,000 per ton. All of these samples are free milling ores, and the party predicts that this Mineral hill is to become one of the greatest mining localities in California, especially because of having the advantage of the heavily wooded river flowing at the base of the mountain.

TUOLUMNE.

Starr King.—*Independent*, June 12: Work in this mine is being energetically pushed forward. The company have a 5-stamp mill which they keep working on ore from the vein, which, though small, is immensely rich. A ton of ore is not as easily mined out of this vein as out of the generality of quartz ledges; but when they do get the returns of a few tons' crushing, it swells their purses amazingly. This mine is one and a half miles below the New Albany, and on the same side of the river, and is worked by steam power.

Spring Gulch.—This mine is situated in Spring gulch, and three miles from the New Albany mine. The mill is a good substantial structure on the improved order, having in place 10 stamps. The ore is transported from mine to mill in Hunter's canyon, a distance of 1½ miles on iron cars. The object in building the mill so far from the mine was to get water power, which is on the high pressure principle. The water wheel is placed 250 ft or more below the mill and the power transmitted by wire cable Steam power is used in hoisting out of the mine. The works in the mine have been carried down between 400 and 500 ft. The vein is found to be 10 ft wide at the greatest depth.

Bunker Hill.—This mine is 1½ miles from the last named mine; and it is rumored that it is about to change hands. In the event that it does, operations will commence, which will give an impetus to the quartz interest in that locality.

Lewis Brothers.—This mine is situated in what is better known as the Big Basin, and was discovered by the Lewis Bros. several years ago. The ore is said to be extensively rich. Owing to limited means the boys are unable to place the necessary equipments on the claim. Like scores of other good mines in the county that are neglected, only await capital to develop and properly work them.

NEVADA.

WASHOE DISTRICT.

Union Shaft.—Gold Hill *News*, June 16: The foundation for the 2500 level plunger pump is being put in, and the station at that level is being opened up. When these works are completed the 2500 station of the Sierra Novada incline will be freed from water and drifts will be started from it to connect with one to be run from the Union shaft and with the drift toward that station from Union winze No. 1.

Yellow Jacket.—The drift from the 2328 station toward Crown Point is making the rapid progress of 10 ft per day, and is now 200 ft in length. Pump No. 13, at the 3000 level, is being put in place.

Sierra Nevada.—The drift west on the 2300 level toward the line of the main shaft is still searching for the west wall of the ledge, preparatory to raising to connect with the main shaft. The extreme heat north on the 2400 level still interferes with work in that part of the mine. As soon as the Union pump at the 2500 level is in operation, work will be resumed at that point.

Con. Virginia.—The drift formerly run south on the 2000 level is being cleared out, preparatory to starting the joint Best & Belcher winze from this level and continuing it to the 2300 level. The drift south on the latter level is making 25 ft per week, and is to connect with the joint Best & Belcher winze above mentioned. The usual output of ore is maintained, the average being about 230 tons per day.

California.—The usual quantity of ore is being extracted and sent to mill.

Union Con.—The northwest drift on the 2500 level, to connect winze No. 1 with the station of the Sierra Nevada incline, is again advancing. The drift south from winze No. 1 toward winze No. 2 is making usual progress through soft vein material. Winze No. 2 from the 2400 level is also making usual progress.

Gphir.—The drift north from the main east crosscut on the 2500 level is making usual progress through a heavy and promising vein formation. The connection between the raise from this level and the winze from the 2300 level has improved ventilation materially.

Choller.—Pumping and raising water as usual. From the south drift on the 2400 level the diamond drill has been sent 200 ft west, and has encountered a mixture of porphyry, clay and quartz giving low assays. This is from a point 165 ft south of the main drift west, the only place where the drill has been used.

Alta.—The east crosscut, 1950 level, is now in 180 ft, the face in porphyry. It is not yet far enough east to reach the quartz formation. Two tons of the base ore on this level have been extracted for the purpose of experimenting to ascertain the best method of reduction.

Bullion.—Since last Saturday's statement the drift east on the 2450 level and from the incline has been pushed 30 ft, and is in most promising quartz carrying some metal. The drift from the Bullion combination shaft and on the 2200 level, to connect with the drift east, has been driven 20 ft.

Belcher.—Work in the drifts both north and south on the 3000 level is once more making good progress. The material in the face of the south drift is without change.

Utah.—Still sinking the incline; total depth, 130 ft on the slope below the 1950 level. The southwest drift on the 1750 level has attained a total length of 525 ft from the incline and continues in good vein material.

Crown Point.—The east drift from the incline on the 3000 level was pushed till indications of water were encountered, when it was turned south toward Belcher, in which direction it has been run 15 ft.

Hale & Norcross.—The work of stoping out the ore encountered in the workings on the 2100 level has been commenced.

Gould & Curry and Best & Belcher.—The work of sinking and timbering the joint shaft is making 40 ft per week and the Sutro tunnel level will be reached about the middle of July; total depth to date, 1,280 ft.

COLUMBUS DISTRICT.

Northern Belle.—*True Fissure*, June 12: An average of 80 tons of ore is being shipped daily to the company's mills at Belleville. In the mine there are 155 men employed steadily. The 600 level, below the adit, is looking splendidly, and the indications are favorable for an improvement. From the top to the bottom the mine has never looked so well in a long time.

Gen. Jackson.—Ore was first struck at 15 ft from the surface, with the ledge pitching north 45°. At a depth of 45 ft the country became much broken up. This continued 45 ft, only occasional hunches of ore being found. At 90 ft a solid formation was reached, and the ledge at that depth was small, but is widening. The ore is of good character. The incline is now down 160 ft.

Lucky Hill.—The tunnel has now reached a distance of 450 ft. Progress is being made rapidly to cut the back ledge. The first ledge was cut at 350 ft from the mouth of the tunnel, from whence drifts were run east and west, both of which expose the ledge very finely. An upraise was made, 340 ft, on the pitch of the ledge, and a well-defined ore body developed the entire distance.

Mount Potosi.—The ore dump is full of first-class ore, and in a few days it is expected one of the Northern Belle mills will start up on it. There are 22 men stoping ore, which will keep the ore-house well supplied, as the number of men can keep a 20-stamp mill running. The ore is slightly rebellious, but easily worked. It is rich in silver, and carries about $15 in gold. It is taken from three different ledges, developed by a tunnel.

EUREKA DISTRICT.

Macon City.—*Sentinel*, June 13: The lessees of the Macon City have turned out to sink shafts and prospect generally in the public highways. A few days ago a seam of ore was uncovered in the main shaft, which seemed to dip from above, and after following it for a few ft they concluded to sink from the surface, and at once commenced to sink a 4x4 shaft in the middle of the wagon road. They had only gone a few inches when they uncovered a large chimney of first-class ore, which will run about $130. The chimney is extending in width, and promises to be the most important strike yet made in the mine.

Lilly.—Mr. E. G. Conroy has been taking out some quartz ore from the Lilly which assays $317. A seam was discovered on the surface and followed down a few ft, when it widened out to 20 inches, and seems to have a natural northeast dip. The ore is a fine granulated quartz and carries some fine carbonates. The owners have started a tunnel on the ledge, and are sanguine of soon opening up a large body.

Mining Notes.—Work is being pushed ahead in the Kit Carson, and the mine is reported as looking well. John H. Roberts has some fine ore on the dump of the Young Ophir, near the Charter tunnel, and reports the mine as looking well. P. Finnegan has located some likely looking ground adjoining the Antelope, on the summit of Prospect mountain. Ed. Looney has two men working the Mary Anu mine, on the western slope of Prospect mountain. The mine is opening out to be a valuable property.

ESMERALDA DISTRICT.

Grand Trunk.—*Herald*, June 12: The ore in this ledge is of the first quality, showing free gold all through, and would, in the opinion of the best judges, average not less than $100 per ton. After leaving this body of ore porphyry was run through for a distance of some 10 ft, when another ledge was struck, the ore of which shows equally well.

National.—The owners have taken out least 60 tons from the National within the past few weeks, and are still at work taking out ore. The average of the 60 tons now on the dump will not, we are told, fall short of $60 per ton.

Northern Belle.—There is a shaft on this mine 60 ft deep. Two drifts have been run south from the shaft a distance of 50 ft, and are both in good ore all the way. The average width of the ledge is 4 ft, carrying $30 rock. Over 100 tons of ore have been worked from the Northern Belle that yielded $30.

Centennial.—The winze is down over 100 ft, all the way in ore that will average at least $75 per ton. The ledge of the Centennial averages 4 to 5 ft. Three tons of this ore crushed last fall netted $1,800.

GALENA DISTRICT.

Mining Notes.—*Silver State*, June 10: We are told that J. A. Blossom, of Battle Mountain, disposed of the Trinity mine, at Galena, to Eastern men, who are now building a concentrator to reduce the ore. Also that the White & Shiloh Co. will start work on the mine shortly. Our informant visited Copper canyon, near Galena, where he found the Supt. of the English Co.'s copper mine excited over the discovery of a 4-ft vein of argentiferous galena on the 530 level of the mine. What percentage of silver the ore carried had not been ascertained at the time of his visit, which was shortly after the galena ore had been discovered. At Lewis he found the Star & Grove mill running, and plenty of ore in sight in the mine.

Important Discovery.—John Biggs, who has been prospecting for a few days at Willow creek, informs us that Lee Folsom has discovered a lead not over a mile from the station, the croppings of which assay $106 to the ton, $67 in gold and $42 in silver.

OSCEOLA DISTRICT.

Gold Plateau and Quartz.—Cor. *Southern Utah Times*, June 3: This district is situated on the northwestern slope of the Snake Range of mountains, in White Pine county, State of Nevada. It is one of the richest gold-producing districts in the State above mentioned, but unfortunately developments have been greatly retarded from the lack of water. One of the richest gulches goes by the name of Dry gulch. Messrs. W. S. Godbe, B. Hampton & Co., have purchased a great number of claims in this gulch and are at present having surveys made for the purpose of bringing a good stream of water to the head of the same. There are numerous other claims in the same place, and fortune is favoring the lucky owners this year for a good sluice stream of water is running down caused by the melting snow near the summit of the mountains. The whole gulch is lined with men working like tigers day and night, for the water will not last over six weeks or two months. To show how rich the gulch is we need only state that these men are now washing the strippings or refuse dirts and are obtaining from $10 to $15 to the man per day. Besides the placer claims, which abound in and about Osceola, there are several first-class gold-bearing quartz ledges.

PYRAMID LAKE DISTRICT.

Jones and Kinkead Mine.—*Territorial Enterprise*, June 10: We learn that about 40 tons per day of free milling ore are being taken from the 300 level of this mine. This ore is being piled up for reduction as soon as the mill is ready to go into operation. On the 400 level they are drifting south. The drift is out 131 ft, and it is expected that the lead will be cut in about a week. The ore on the 400 level contains a great deal of copper. A quantity of it has been sent to Denver for reduction as an experiment. The Jones and Kinkead is at present the leading mine of the Pyramid Lake mining camp, and should it be found that the ores it produces can be profitably worked, renewed activity will be seen in all that region, there being quite a number of veins on which more or less work has been done in the way of running tunnels and sinking shafts.

REESE RIVER DISTRICT.

Manhattan Co.—Letter of the 11th says: During the week the mill has reduced 143 tons 616 lbs of ore of the assay value of $48,570.93. Of this amount $3,668.30 were from the Curtis shaft, $3,644.94 from the Ruby incline, $18,155.90 from custom ores, and $23,101.70 from tribute ores.

WHITE PINE DISTRICT.

Con. Treasure.—*News*, June 10: The property consists of the Central Treasure and Bay State mines on Treasure hill. The main shaft, now being sunk on the Bay State, will be one of the best on the hill. A drift has been run from shaft No. 2 to connect with the main shaft at the 100-ft station, as soon as the latter reaches that depth. This connection will furnish good ventilation for all future prospecting. Work on the main shaft will be pushed as fast as possible.

ARIZONA.

Calabasas District.—Tucson *Citizen*, June 10: Mr. B. N. Brajovich, partner of Joe Sresovich in the Brothers mine, has just returned from Calabasas with some fine specimens of gold-bearing rock. This mine is the eastern extension of the Gold Hill mine, is situated in the Mohave mountains, 1 mile from the Santa Cruz river, and is distant about 70 miles from Tucson. Though only down 10 ft, the rock is rich and constantly improving in quality. Fifty thousand dollars has just been refused for an adjoining mine, and Mr. Sresovich says the Brothers mine is not for sale, as he intends to work it himself. A party fully equipped with tools and provisions will leave Tucson for the mine on Saturday.

Globe District.—Phœnix *Expositor*, June 11: Another rich strike has been made on the Albert Lee. The Lee bids fair to be one of Globe's bonanzas.

Rich Silver Ore.—About 16 miles south of Globe, in the Pinal mountains, a high-grade, galena, silver-bearing ore body has been struck, measuring 5 ft from wall to wall, the ore brought into town assaying from 300 to 800 ounces in silver, besides carrying about 40% lead. Plenty of wood and water in the immediate vicinity of the ledge.

Strike at McMillen.—Mr. Arthur and others from McMillen have struck it way up near Rambor camp. The ore is a chloride and native silver with a light copper stain. Six sacks of the richest found so far represents a value of $4 a lb.

Silver Era.—In the Silver Era a big pocket of 700-ounce ore has been struck, at a depth of 160 ft only.

Richmond Basin.—Neither is Richmond basin behind in the discovery boom. Several new locations yet bid fair to rival in richness the old-time bonanzas there.

Santa Ritas.—Tucson *Star*, June 11: The Goldtree mine is attracting a great deal of attention. It is one of the best locations in Major camp. The shaft is 14 ft deep, and there are 40 tons of assorted ore on the dump. Assays show $116 in silver and 50% lead. The owners are preparing to erect a smelting furnace.

Tombstone District.—*Epitaph*, June 12: The Head Center is daily improving. On the 210 level there is an ore body 350 ft in length and 3 or 4 ft in width, which the Supt. says will average at least $100 per ton. The drifts on this level are being extended both north and south in good ore.

Tough Nut.—On the 125 level, connection has been made with the shaft and a breast of ore opened up 20 ft in width; this will pulp $200. No. 2 winze, 150 ft east of the northwest shaft is now 55 ft deep, all in ore that will go $90 to $100, and improving in character as depth is attained. East from the main shaft 150 ft a crosscut of 18 ft, through 8 ft of porphyry and 10 of carbonate ore, leads to a winze 32 ft in depth, in magnificent ore all the way down.

Grand Central.—On the 200 level, drifts are being run north and south along the ledge. The south drift is in over 100 ft, and the miners have run north toward the Contention about 88 ft. At 70 ft in this drift a handsome ore body was struck which continues good in the face of the drift. This strike has produced some of the handsomest chloride specimens we have seen in the district.

Tombstone seems to be enjoying a season of prosperity. The Sycamore water company is pushing the laying of pipe, and will soon have plenty of water.

COLORADO.

Clear Creek Co.—Georgetown *Miner*, June 5: The Baltic is one of the best mines in this section of the country. They have now reached 220 ft below the Britannic tunnel lode, and have a 5-ft streak of 100-ounce ore. The work of developing the mine goes on very rapidly.

A. V. Still Lode.—Capt. McGuire and Henry Warron are the owners of this lode, and undoubtedly have a bonanza. They have 2 ft of solid mineral, which will run 500 ounces of silver to the ton. This mine is bonded to Eastern capitalists for a large sum.

Niagara Tunnel.—This property consists of 12 lode claims lying in Spring gulch, about 2½ miles from Idaho springs. The principal developments are on the Niagara and Byron lodes, which have been intersected by the Niagara tunnel and explored by drifts 50 to 60 ft in length. About 200 tons of ore, ranging in value from $30 to $90 per ton, net, have been taken from these lodes during the process of development. The Donaldson possesses the largest share of developments. It has been opened by several shafts which show from 12 to 26 inches of auriferous quartz worth from $71 to $431 per ton.

Dominion Mining and Smelting Co.—This is a comparatively new company, and is operating in Hukill gulch. The Dominion lode is opened by 4 shafts, aggregating 165 ft in depth. These developments show a pay vein 18 inches in width, consisting of iron pyrites, copper pyrites and galena, the galena predominating. A late run of 75 sacks milled $337 per ton in gold, silver and lead, the latter running 35%. Specimen assays have run as high as $600, but the best criterion of the value of the property consists in the fact that it paid for development, and also that a small run is taken out nearly every week.

Custer County Mines.—Silver Cliff *Prospect*, June 8, The Polonia has 2 shafts respectively 95 ft and 102 ft deep, and from both very rich ore is being taken. The vein proper from wall to wall is 4 ft, with a 14-inch pay streak of gray copper that is widening with every ft of depth gained. The mill runs from the present depth are from 65 to 300 ounces in silver. Assays from the same have run as high as 800 ounces in silver. A 20-horse power engine has been ordered and will be at work in a short time. The 05-ft shaft, in which they are now at work night and day, will be sunk to a depth of 700 ft, with a number of levels from different depths. The ore from this mine is being milled as fast as taken out.

Horn Silver Mine.—Work has been resumed on this mine, the parties to whom it was bonded being in forfeit. We trust the owners will profit by their experience, and will, with the 2,000 tons of 30-ounce free milling ore on the dumps, proceed at once to erect a large mill and become large producers of bullion.

IDAHO.

Challis.—Cor. Yankee Fork *Herald*, June 5: The smelter which has been in course of construction at Bay Horse, under the management of Mr. Longmaid, has come to a standstill for the present, but will soon be resumed.

Another Furnace.—It is said that another smelting furnace will be put up on the Salmon, opposite the mouth of East Fork, under the auspices of an Omaha company. It is asserted that the requisite capital is in hand, and that the work will be commenced at once and prosecuted to completion with all possible vigor.

Upper Salmon.—Owing to the extraordinary inclemency of the winter, and the isolation of the country from the great railroad world, the Upper Salmon is long in getting a start; but when once it is given a chance, it will keep up its reputation as the greatest producer of the metals, precious and useful, between the Rockies and the Pacific.

MONTANA.

Butte District.—*Miner*, June 12: The middle shaft on this mine, in which a strike was recently reported, is down 130 ft and work is still being vigorously prosecuted. The lower level, running east from a point 100 ft from the surface, is about 50 ft in length and is yielding some magnificent silver ore carrying also from 30% to 50% copper.

Anselmo.—This sterling property is growing daily more valuable. The east and west drifts, 70 ft from the surface, have each penetrated the ledge about 88 ft and show a handsome body of very high grade silver quartz.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

New York & Bodie M. Co.—Object: To carry on a general mining business in California. Capital, $5,000,000. Directors—W. S. Chamberlain, G. E. Hutchinson, J. M. Masterton, H. A. Johnson and E. W. Whitney.

Mexican Union M. Co.—Object: To carry on a mining business in Columbus district, Esmeralda county, Nev. Capital, $10,000,000. Directors—George Storey, Victor Fernbach, D. Fay, Frank Tagliabue and U. Mayers.

Constantine G. M. Co.—Object: To operate in Mariposa county, Cal. Capital, $4,000,000. Directors—David Porter, N. C. Fassett, A. F. Main, H. N. Jacobs and Geo. Storey.

Southern Nevada G. & S. M. Co.—Object: To operate in Esmeralda county, Nev. Capital, $10,000,000. Directors—H. L. Coye, J. G. Lavery, H. L. Fox, E. E. Elliot and J. J. More.

Carbonca M. Co.—Object: To mine in Sonora, Mex. Capital, $10,000. Directors—S. F. Gashwiler, J. W. Roberts, C. A. Burgess, C. F. MacDermott and G. W. Grayson.

Chicago Con. S. M. Co.—Object: To mine in South Fork district, Shasta, Cal. Capital, $10,000,000. Directors—F. H. Wells, E. C. Freelsnd, William Irelan, John Nuttall and P. B. Bowles.

Tombstone Mining District.

Description of its Geological Features and its Principal Mines—Resemblance to the Comstock.

The following description of Tombstone district and its principal mines is based on notes taken by Mr. E. N. Riotte, M. E., during a recent professional visit to Arizona. Mr. Riotte is wsll known in the profession and the mining community, and his observations and conclusions will be received with great consideration.

Topography—Wood and Water.

Lone monntain, half way up which the town has crawled and nestled, rises gradually from an almost circular basin about 30 miles in diameter. San Pedro river winds fully half way around the base of the mountain, which rises about 1,500 ft. above the subjacent plain. At the date of Mr. Riotte's visit, during the latter part of May, Tombstone had a livsly population of 3,500 to 4,000, and there were perhaps 500 houses, which had been mostly hastily improvised. All the water is haulsd from wells sunk in the granite about three miles from ths mines. A copious supply of water could be procured from Huachuca monntain, 22 miles distant. There is no wood whatever in the vicinity of the district, but both lumber and wood are brought from Hnachuca. The introduction of water would effect a large saving hoth to the town and the mills, and would besides permit the reduction of thonsands of tons of ore which have no present value. The cost of water for the hoisting works alone amounts to hundrsds of dollars.

Geological Features.

Lone monntain proper consists of porphyry of a fine-grained feldspatic variety, generally stratified and uplifting east and west. Upon the porphyry rested a limestone, probably of the triassic age. A young, square-blocked, fine-grained granite, which outcrops heavily towards the northwest, is the evident cause of the upheaval of the mountain. The presence of "hlack" dikes—that is, ledges of grayish-black basalt—would appear to indicate the mors or less direct causes of the veins and ore deposits, The limestone is highly mstamorphic and alternates with what was once sandstone, but now quartzite, and agaiu with what was once clay slate, bnt now argillaceous schist; at places, indeed, almost gneiss. Every indication points to the exceedingly intersting proposition that the veins and ore deposits in this district were formed before the upheaval of the mountain mass occurred. In eupport of this theory the following reasons present themselves: 1. There is no sign of solfataric action on the surface. 2. The veins, eo far as observed, do not enter the granite. 3. The depth to the water is so great that it is improbahle that springs or other water ever passed up to the surface in its present condition. 4. The decomposition of hoth the ore and the gangue has been done from above, the porous earth and ledges allowing a free passage downwarde of the eurface water. If this theory is correct, the veins will be found still better filled when the water level is reached, let us say, at a depth of at least 400 ft. Thie eetimate is based partly on the hight of the water in the welle, which ie retained, wherever it ie found in this place, by the fine-grained, eolid granite.

Characteristice of the Veine.

The Contention is at present the most valuable mine in Tomhstone. It is a representative fissure vein—a veritable "veta madre." It is so strong and palpable that no competent person hesitates for a moment in giving a decided judgment as to ite character. Even the Comstock devotee, after a glance at the splendid vein, raises his hat and exclaims with pride: "Yee, this is another." In places the walls are over 100 ft. apart. Bnt eo far the best ore body developed has been about 15 ft. wide—that is, yielding ore of a high grade. The clay eelvage on the walle is distinct, and the cleavage of the country rock ie perpendicular to the ledge. The so-called foot or east wall has at the surface a dip of 65°, while the dip of the west or hanging wall is somewhat less. As depth is gained the east wall straightens, and at a certain depth both walls go down nearly perpendicular. Judging from the indications in the Contention and the Head Center there is every chance that the great vein will finally pitch to the eastward. The east and west country rock is lithologically identical—propylite or porphyry. The east country rock exhibits more decomposition, or the action of steam or hot water. This appearance would eeem to strengthen the indications already stated, that the east or footwall will become finally the hanging wall. Thie feature of the vein will at once arrest the attention of every one familiar with the peculiaritiee of the Comstock.

The filling matter of the vein is partly quartz very much decomposed, and partly "horse" matsrial. The grayish porous quartz is invariably rich, the silver-bearing mineral being chloride, bromide and iodide, and chloro-bromide ores. Where the country rock has fallen into the vein it is found to be seamed and decomposed; and on the facee of the seame are pieces of chloride ore varying in eize from a pin to that of a man'e hand and as thick as a half dollar. This greenish horn silver so fully impregnates the seams of the country rock that it pays to mine. In the Head Center the sidee of a drift for the length of about 15 ft. are covered with small points of free gold; and fully one-fourth of ths bullion produced from the ore of this mine is gold. It presents similar characteristics to the Contention, including the basalt dikes. The three mines known to be on this great vein are the Contention, Head Center and Grand Central; it is probable that the ore passes through the Tranquility and Empire.

The Contention

Is nearly 300 ft. deep. It has a good mill of 20 stamps on the San Pedro river, 9 miles from the mine. Hauling ths ore costs $4 per ton. The present yield of the mine is about 50 tons per day, and scarcely shows the beginning of stoping. The ore is free milling, and is worked up to 80% and 85%, and the bullion is over 800 fine. The daily product of bullion ranges from $5,000 to $7,000. The cost per ton for mining, hauling and milling is about $17.

The Head Center

Is located about 100 ft. lower down the mountain sids. It is about 300 ft. deep, and is, therefore, the deepest mine in ths district. It has been opened systematically and thoroughly, and discloses the vein in all its perfection in the deepest working. No ore has yet been stoped, and as little as possible of the rich horn silver has been broken down in running the working drifts. Still there are from 300 to 400 tons of very high grads ore on ths dumps, plainly showing the presence of both vein and ore. The mins is quite ready for a large mill.

The Grand Central

Shows the vein at one end just as it is in the Contention; bnt in passing through a ridge of quartzite it has been somewhat pinched at one point. Beyond this fault the ore body continues very regular, and averages about 4 ft. thick, 2 ft. of which are of high quality.

Other Mines

Ars, as yet, nnimportant. The Tough Nut, although producing a large amount of good ore, is simply a series of bunches or nests in the limestone—an exact counterpart of the occurrence of ore at Mineral Hill, Nevada. Besides the mines mantioned thsre are several small, well-defined veins with holss from 20 to 40 ft. deep, which are offered at prices to suit every condition. There is no doubt that the Contention, Head Center, Grand Central and other locations on the great vein will bs worked and heard of for many years to come. The bulk of the others will answer the purpose of the "chloriders"—a class of miners indispensable to a lively camp.

Town Sites Located on Mineral Lands.

Recently Secretary Schurz, in answer to the resolution calling for the information, transmitted to the Senate a report from the Commissioner of the General Land Office concerning the entries of town eites on mineral lands. In his report the Commissioner exhibits the practice of the office under the laws, and cites instances of the difficulties which have occurred where town eites have been located on lands valuable for placer mining. After pointing ont the defects in the existing laws, the Commissioner suggests that if a new law be enacted it should embrace the following requirements:

"1. Where the mineral locatione of lodes or placer mines antedates the town occnpation, the patent should issue without reservation to the mineral claimante. 2. Where the land is occupied as a town prior to the mineral location, and the character of the town occupancy is clearly permanent and in good faith, the same rule of priority should control, and the patent, without reservation, ehould issue to the town authorities, without regard to the character of the land. 3. Where the ground is known to be mineral in character, the location of mining claime and buildings, and the occupancy of dwellings, etores, etc., proceed contemporaneously, a very difficult question of fact arises in every case. When surface occnpants have decided upon a permanent organization, it is in their power to immediately apply for a patent, and if any delay in the preparation is necessary, they can at least give a published notice of their claim, with its bonndaries, and file the same in the district land offices; and this would he a full notice from its date to all subsequent locations of mining claims, and of the rights of the town to unlocated grounds should attach, and the patent issue without exception in favor of each of the enbsequent locators, while the prior location, made during the period when everything except mining location was considered as transient and calculated only for temporary purposes, should not be embraced in a town-eite entry, but subject to entry and patent without any reservation, by the individual owners thereof."

Secretary Schurz concurred in the suggestions of the Commissioner.

A Novel Process.—Quite a novelty in metallurgy is reported to be one of the features of a new chlorination process, and consists in the separation of the gold by filtration through or agitation with charcoal (or bone-black). The gold is thereby reduced from its eolution and precipitated in the metallic etate on the surface of the charcoal, coating the fragmente with a brilliant film of gold. This singular phenomenon seems to be a physical and not a chemical actiou.

On Geodes.

By Chas. D. Cibbes, C. E.

This interesting specimen presented this evening by Mrs. D. D. Colton, whethsr it is a geode or not, cannot be passsd by without some remarks. I will state a few facts that I have observed, and lsave it to those better informed on the subject to give their opinion on the formation. Not seeing them in place renders it mors difficult to determine. But perhaps there is some member present who has bssn on the gronnd and can describe them more accurately.

Here is a cylinder 10 inches in diameter, of a very regular shaps, nearly a perfect circls; and the longitudinal section 9 or 10 inches; both ends heing broksn off it is impossihle to determine the original length. The rim of this cylinder is of a regular sizs, just 7·20 of an inch thick. It is composed of a fine silicious, agatizsd dsposit from a solution of silica. The extreme outsr edge, about the thickness of the back of a table-knife, is translucent, resembling opal; the rest of the rim is opaque, with two very narrow bands of different tints on the inner edge.

The cavity of this cylinder is lined with granular quartz nearly two inches thick. The inner surface, however, is studded with crystals of quartz pointing towards the center. The bottom, or one end of ths cylinder, contains a convexed cluster of quartz crystals radiating from the csntsr. Interspersed with the white quartz crystals are a few brown crystals of calcits, not more than two dozen, showing that a small portion of lime was also held in solution. Now the question arises, what was ths matrix in which this cylindsr was formed, was it a geode or not?

Webster delines a geode as a rounded nodule of stone containing a small cavity nsually lined with crystals, though sometimes with other mattsr.

In 1877, I exchanged some of our duplicatss for several specimens from Chnrch Buttes, said to be fragments of geodes, which are here exhibited. Two of thsss ars similar in composition to the one presentsd by Mrs. Colton, that is, they have the agatized rim and the crystallizsd quartz. The diameter of the largest segment when perfect was 12 inchss, and the rim is twics as thick, and like the psrfect cylinder has no matrix surrounding it. But you will perceive in the smaller segment that the rim of silica has an outsr coating, about 8-10th of an inch thick. This is mostly calcareous matter, but contains some silica, and somewhat resemhling solidifisd mortar, the outer surface being smooth aud as perfect as the innsr circle. As near as I can judge from this small segment, the diameter must have been 15 or 16 inchcs. A third specimen showe a solid and more compact form of the agate deposit. Two other specimens are crystals of calcite instead of quartz, also found in geodes.

New Gold-Saving Machine.—The editor of the Mammoth City *Herald*, Mono Co., has been ehown a letter received from France, describing a contrivance for working tailings from placers. The writer eays: "My apparatus has been working for eome time with great success in the province of Marcia, Spain, and I cannot see why it should not work with the same results on the Pacific coast, where there are so many unworked placers and quartz mines. My apparatus can be built so lightly that it can be easily packed on mules and moved from place to place as necessity requires. It necessitates the uee of very little water, as one and one-fourth cubic yards of water will wash one cuhic yard of dirt or sand, and by working with care the result is absolute—without any loss whatever. The first experiments were made in Paris, where twenty colore were filed from a gold coin and mixed with six cubic inches of sand. After washing with my machine the quantity of gold remained intact. For dry diggings the machine would be of no use, for it requires a emall amount of water. Gold placers and quartz-hearing gold are better worked by my process than any other, as there is no loss whatever; the smallest particles cannot escape—even the float. Tailings have been worked in Portugal, and all the gold extracted at a trifling expense."

The Skagit Mines.—A dispatch from Seattle, W. T., June 3d, says there are at present about 400 men in the diggings, all well provisioned, and, so far as the old miners were concerned, were well satiefied. The snow has entirely disappeared from the creeks and benches, which are already dotted with miners' cabins, and in many instances with little garden patches, on which lettuce, cabhage, beets, potatoes, etc., are already well advanced. The water is still so high as to render sluices and flumes impracticahle. However, considerahle gold is being taken out with pans and rockers. The trail is completed from Portage to Goodell's, while the first pack train, consieting of five animals, ie expected to start ont from Souk City, on Satnrday, for Goodell'e. The most difficult portion of the trail still remains to be constructed, but it is expected that considerable addition will be made to the present force, and work will be puehed through rapidly. The new eaw mill at the mouth of Canyon creek is expected to be turning out lumber in about a month.

The quartz excitement about Auburn still continues, and new ledges are being prospected every week. From one of them the fortunate owner exhibite a handful of specimens containing over $300.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

DECISIONS OF THE U. S. COURTS.

Sharp vs. Tifft.

U. S. Circuit Court, Southern District of New York—Decided May 8, 1880; Wheeler, J.:

1. Substantially the same combination of devices, although of different form and capacity, having been used before the patentee's invention, he is entitled only to his particular form of devices which are really different, and the combination of these dovices with each other or with others so as to produce a new result or an old result in a new way.

2. A reference in a disclaimer to a particular form of the device not so limited in the claim is merely descriptive of that form without taking away or adding anything thereto.

3. When the reissue describes only what was described in the original patent, both as to the devices and the nature of the invention, it cannot be said that the invention in one is different from that in the other, although the claims have been changed and enlarged.

4. A patent for a combination of parts, materials, or elements is not infringed by the use of any number of the parts, materials or elements less than the whole.

5. When some parts of the combination are new, and those parts are taken and used in the same manner, but with different elements for the rest of the combination patented, a part of the invention is taken, although the whole is not, and it is an infringement to that extent.

6. A disclaimer filed after the suit was brought ordinarily deprives the plaintiff of costs in the suit, but where the disclaimer was not necessary to sustain the patent to the extent it is held valid, was inoperative, in the view taken of it, upon the patent and has no effect in maintaining the suit, cost may be allowed the plaintiff as though no disclaimer had been filed.

This suit is brought upon letters patent No. 50,938 issued to T. J. Kelly for an improvement in burners for gas stoves, dated Nov. 14, 1865, and reissued to the plaintiff No. 6,832, dated Jan. 4, 1876.

The defenses set up and relied upon are that the reissue is for an invention different from that described in the original; that if not, Kelly was not the first inventor of all the material parts of the invention patented, and that the defendant does not infringe.

A decree entered for an injunction and an account accordingly, with costs.

Allen ve. City of New York.

U. S. Circuit Court, Southern District of New York.—Decided Dec. 13, 1879; Wheeler, J.:

1. Reissued Patent No. 21, to Aaron H. Allen, Jan. 15, 1861, for improvemente in seats for public halls declared valid.

2. The seats in the original patent were to be turned up by weights, while in the reissue the weights may be dispeused with and the seats moved up otherwise: *Held*, that the reissue is not for an invention different from that contained in the original patent.

3. Although the stove door, carriage-seat for a child, an opera-board to a carriage, relied upon in defense, are turned down, stopped, and held, and turned up out of the way as are these seats, such contrivance are not anticipations of this invention, since they could not be arranged as seats in public halls without additions and alteration requiring the exercise of invention.

4. A description in a prior patent is no anticipation of a patent the application of which was filed before the application of such prior patent.

5. The defendent in this case is a proper party to account for profits, as are also its board of education and department of instruction, by whom the seats constituting the infringement were introduced into the schools.

Perkins vs. Nashua Card and Glazed Paper Co.

U. S. Circuit Court, District of New Hampshire.—Decided May 15, 1880; Lowell, J.:

1. As the law seeks to encourage inventors to make known their inventions and to discourage an extension of the monopoly beyond the statutory period, and because of the difficulty in determining the amount of knowledge derived from the exhibition, publication and use of an invention, it has always been held that where the public have had means of knowledge of an invention they have had knowledge of the same.

2. To establish the fact of public use, actual knowledge of the invention need not have been derived by anyone interested to practice it, but it is enough that anyone or more persons, not under pledge of secrecy, saw the invention, or even might have seen it if they had used their opportunities, provided it was, in fact, practiced in the ordinary way after being completed.

3. Where there has been no pledge to secrecy the visitors and workmen at a factory must be held to be either part of the public or persons from whom the public may acquire the art without breach of trust.

4. *Doubted*, whether a pledge of secrecy exacted of a number of workmen who had nothing to do with the machine in question, and had an opportunity to examine it, would make the use a secret one.

5. A machine which, whether entirely satisfactory or not, has been run in the ordinary course of business for 20 or 30 years, and which is patented precisely as it was used, cannot properly be called an experimental machine.

* More complete reports of the proceedings may be found on file in the office of the Mining and Scientific Press Patent Agency, 202 Sansome street, S. F.

Perplexed Writing Experts.—The experts in handwriting have a very tough joh on hand at Washington just now, in the mysterioue letter which was received by Springer, apropoe of the Donnelly contest. The peculiarity about this letter is that the handwriting closely reeembles that of several people. It is very like the writing of Finley, of his clerk, of King of Minnesota, and lastly of Springer himself. It will be remembered that Springer attributed it to Finley, Donnelly to King, and now some people are inclined to think that Springer may have written it himself. This puzzle serves to show that it is by no means easy to trace handwritiug, and that the conclusione of experte upon the identity of handwriting may be entirely erroneous, no matter how careful their researches. There are at present many thousands, or hundreds of thousande of people, who write a bold, round, commercial hand, having a etroug general resemblance. Those who are taught in the modern echools perhaps acquire lese individuality than wae common of old, and this may be one cause of the embarrassment which the Washington letter is creating.—*Sacramento Record-Union.*

Placers in Klamath Co.—Placer mining on the Klamath and ite lower tributariee covere a linear extent of over 200 miles, reaching from the main stream down almost to the ocean, a distance of 120 milee, and along Scott river and the Salmon some 50 or 60 miles, some little work being also done on the smaller branches of these rivers.

The Engineer.

The Proposed Illinois Ship Canal.

Mr. Daniel C. Jeanne, Chief Engineer of the Illinois and Michigan canal, contributes to the Chicago *Inter-Ocean* the following account of the proposed through water route from the great lakes, at Chicago, to the Mississippi river:

The first division of the project consists in the enlargement of the Illinois and Michigan canal from Chicago to Joliet. The present canal was built 48 ft. wide on the bottom, 60 ft. surface width at six ft. deep, or below the low water of Lake Michigan. It is proposed to make the enlarged canal 144 ft. wide on the bottom and 160 ft. wide at surface at eight ft. deep, with a descent of two-tenths ft. per mile. This will give a current of 1.06 miles per hour.

The canal enters the Desplaines river about one mile and a half north of the main street at Joliet, and will be about 33 miles long. Three lift-locks will be required at the southern end, one grand lock at Bridgeport or north end, six public road and street drawbridges, and one double railroad drawbridge, and a large water weir at Lockport. The locks are to be 350 ft. long between the gates and 75 ft. wide, to correspond with those now built on the Illinois river.

The second division of the canal from Joliet to La Salle, about 67 miles, will consist of the improvement of the Desplaines and Illinois rivers by locks and dams, and an independent short piece of canal around the rapids at Marseilles. This will require the construction of 11 locks, 9 dams, the raising of two dams, 9 drawbridges, the independent piece of canal above referred to, and other incidental work.

The third division consists in the improvement of the Illinois river from La Salle to Grafton, on the Mississippi river, distance 227 miles. Of this, 90 miles have been finished by the construction of two locks and dams.

Total estimated cost of the entire work will be $18,296,918, of which amount $1,336,107 has already been expended. According to this estimate the canal, 327 miles long, will cost $55,560 a mile, and will have 12 times the capacity of Erie canal, which cost about $90,000 a mile. This route opens an inland water communication between the Gulf of Mexico, New Orleans, St. Louis and other cities of the great West and Southwest, through the city of Chicago, with the city of New York in one direction, and with the cities on the St. Lawrence river and the Gulf of St. Lawrence in another direction, and through both routes and the extremes with the Atlantic ocean.

The dimensions of the proposed canal are sufficient to admit boats of 2,500 to 2,800 tons burden, being 80,000 to 85,000 bushels of grain, or one and a half to one and eight-tenths million feet of pine lumber; or fleets of smaller boats can pass the locks at the same time with about the same tonnage, or 12 of the boats of the Erie canal, or the Illinois and Michigan canal, can pass the locks at one lockage.

The summit level of the canal could be reduced to 100 ft. on the bottom with the same slopes and declivity, and construct basins at every mile 500 ft. long and 50 ft. wide for boats to pass, and reduce the cost of the first division about $4,000,000, and these at 10 ft. deep would pass over 100,000 cubic feet of water per minute.

NEW METHOD OF CONSUMING SMOKE.—It is well known that the cause of smoke is that the fresh air, entering the incandescent coal from below through the grate, has often all its oxygen consumed before it has passed half way through the layer of coal, so that the upper part of the layer cannot burn, but is simply heated by the underlying incandescent coal, while the products of the combustion of the lower layer of burning coal pass through the upper heated but not burning layer, and carry with them the combustible gases evolved by the heat, but which cannot take fire from the want of free oxygen. In order to furnish these combustible gases ascending through the upper layer of coal with the necessary oxygen to burn, Mr. Benjamin F. Sherman, of Ballston, Spa., N. Y., has devised a means of introducing air in the furnace with a downward injection upon the fire by a vertically adjustable arrangement of pipes, which may be placed close to the coals or further from them, according to the requirement of the case.

LAUNCHING A BRIDGE.—In constructing a railroad bridge over the river Ranee, at Dinard, in France, the engineer decided to build the bridge on the shore and launch it over the river. The bridge weighed, when it was complete, 2,600,000 pounds, its hight above the river was 100 ft., and the span 314 ft. Twelve windlasses were used to draw the bridge into its place. It was supposed that four or five days would be sufficient for the work, but, in consequence of the breaking of a chain, two weeks were required.

GREAT INCREASE OF TONNAGE.—The shipping of the world is now estimated at 20,000,000 tons, which is 10-fold greater than the figures of two centuries ago. It is especially noteworthy that it has doubled within the last 25 years. Accompanying the increase in tonnage, there has also been a vast increase in speed, so that the amount of maritime commerce now is at least 40 times greater than in the year 1680.

Useful Information.

OLEOMARGARINE appears to be coming largely into use in many parts of the East and in Europe, and, so closely is it made to imitate butter, that a loud demand is being made to prevent, by legal enactment, the growing deposition to palm off this compound for the genuine product of the dairy. It is claimed that, while the fullest liberty should be given to every one to smear his bread with whatever he may choose to put thereon, some law should be devised to protect people from even the chance of ignorantly swallowing that which, knowingly, they would not take into their stomachs; that when hog, and dog, and cat are thrown upon the market in such minute division that their anatomy cannot be plainly made out, their proper place in nature shall be plainly made known by labels. Let oleomargarine go from factory to mouth as oleomargarine, and not let it be passed off for its country cousin. Make it slander, if deemed, to call it "bull-butter," but make it felony to say that it is Alderney. Many ways have been suggested for the detection of oleomargarine, one of the best of which is the microscopic test. Under the glass, milk-butter shows a mass of globules similar in size and appearance, with intermediate layers of salt and water. Oleomargarine shows a mass of what appears to be fan-shaped and fibrous crystallizations entirely different in character and appearance from butter.

A PECULIAR case in relation to weighing scales has recently been decided in an English court, which may be of great interest to scale makers and users in this country. It seems that there is a scale known as Salter's Family Seale, which consists of a bowl-shaped scale on an upright pillar and a finger and dial regieter underneath. It is said that 40,000 of these scales are made every year, and thousands of them are in use in the government departments. It was alleged by the prosecutor in this case, that by placing the goode to be weighed on one side of the scale, and not exactly in the center, the weight was erroneously registered, sometimes to the extent of several ounces. The defendants, being a Manchester firm who had sold one of these scales, were found guilty of the charge of having sold a false or unjust balance, and were sentenced to pay a fine of 20 shillings and costs. As might be expected, the case is to be taken to a higher court.

WAXING FLOORS.—The following is a good recipe for waxing floors and the method of application. Stir 25 parts of shredded yellow wax into a hot solution of 12 parts of pearlash in soft water. Keep the mixture well stirred until the effervescence ceases; then remove it from the fire and stir in 12 parts of finely ground yellow ochre. It may now be poured into cans to cool. When wanted for use one part of it is dissolved in five parts of boiling water. Apply warm with a paint brush. It dries in a few hours, when the floor is polished with a floor brush and afterward wiped with a woolen cloth. It is said this wax coating will last for six months with ordinary use.

FERNS AS FOOD.—Most of the ferns found in our woods contain more or less starch, and when properly prepared are extremely palatable and nutritious. An attempt was recently made in France to popularize them as an article of food. The young shoots of the common brake fern, when exposed above the soil to the air and sunlight, become exceedingly fleshy, white and tender. A famous French painter is known to pride himself on his fern omelets, and the hill tribes of Japan live on fern all the year round. In spring they eat the tender leaflets, and later in the season they eat the starch extracted from the roots.

"BONSILATE."—A new industry is reported to be growing up in Newark, N. J., which which yields a product suitable for many purposes. "Bonsilate" is the name given to this substance, which it is claimed, will take the place of ivory, rubber, celluloid and similar materials. It is said to be composed chiefly of finely ground bone, agglutinated by some cementing compound, which, when in its plastic state, can be molded into shape.

MAGNETIC WRITING.—Prof. Thompson, of Bristol, has lately made an interesting observation in regard to an application of magnetism. He takes a thin plate of hardened steel and writes upon it with a magnetized iron style, thus communicating a tolerably permanent magnetism to the parts of the plate which are covered by the writing. If fine iron filings are sprinkled upon the plate and the plate is then held perpendicular, so as to remove the loose filings, the writing becomes visible upon the magnetized portion. The experiment may be repeated at pleasure for an indefinite period.

UTILIZING SLACK.—The vast amount of fuel in the form of "slack" or "duet coal" which is now wasted suggests a promising field for inventive genius. Anyone visiting the coal regions is astonished at the quantity of this refuse thrown out of each mine. These heaps of fine coal loom up like small mountains, and often contain, it is said, a million tons, all of which can be burned. The Philadelphia & Reading company has a process for consuming this waste in some of its stationary and locomotive furnaces, but compared with the aggregate produced the amount thus disposed of is trifling.

ARTIFICIAL AMBER.—Articles made of imitation amber are now produced in immense quantities and of beautiful appearance, and sold for the natural material. The resembling substance thus employed is principally colophony—a resin obtained by the decomposition of turpentine—though many other ingredients are also made use of to give it the requisite qualities. So perfect is the imitation said to be, that the false substance has the electrical properties of the true, and some ingenious fabricators have even managed to introduce into the substance foreign bodies, insects, etc., to render the similarity more striking. The means of detection are simple. Genuine amber requires a heat of 545° to 550° Fah., to melt it, while the spurious substance becomes liquid at a much lower temperature. Again, while the true article is only slightly attacked, after a very long time, by ether and alcohol, the imitation rapidly loses its polish in contact with such liquids, and soon becomes soft. True amber pieces of small size may be formed into a lump of much greater value, by moistening the surfaces to be united with caustic potash, and pressing them together while warm.

A NOVEL RIDDANCE FOR RATS.—An inventive genius filled a small tarleton sack with a spoonful of cayenne pepper, and tacked it over the rat-hole. When the rat bounced out, his eyes were peppered by the sifting from the shaken sack. He squealed like a pig, and escaped. The whole tribe have since migrated.

EFFECT OF WATER PRESSURE.—The pressure of water on the main reservoir pips in Lansingburg, N. Y., was recently so great that it forced off the main valve, which weighed a ton, and threw it 50 ft. The water that followed rose 150 ft., struck the embankment of the Troy & Boston railroad, and washed away 25 ft.

CREMATION appears to be making rapid progress in Germany. During the year 1879 15 cremations were performed at Gotha. The Cremation Society of Milan has burned 48 bodies in the last three years.

HOW SNAKES MOVE.—Snakes creep; they have a series of muscular rings along the body, by the contraction of which, in rapid succession, they move over the ground. Watch the next one you come across.

FORCE of water in freezing is 30,000 lbs. pressure per square inch.

Good Health.

New Treatment for Cancer.

The London *Lancet* calls attention to an important series of investigations conducted at the Queen's hospital, Birmingham, as to a new method in the treatment of cancer, by Mr. John Clay, professor of midwifery at Queen's College. Hitherto this terrible disease has proved incurable by medical treatment; but the inquiries and experiments conducted by Mr. C. lead to the belief that by the use of Chian turpentine—which he has been the first to use—cancer can be not only arrested, but cured, without a surgical operation.

Mr. C's. paper was published in the *Lancet* of March 27th. He recommends his treatment especially in cases of cancer of the female generative organs. He says that he had made extended trial of various remedies, both general and local, but not last concluded that if cancer could be cured it must be by medicine administered internally, and must be of such a nature that it could be taken for a long time without affecting special functions or general nutrition. A study of the pathology of cancer led him to the opinion that a carbo-hydrate of some kind might prove beneficial, and for several reasons he decided that Chian turpentine might prove the most suitable. An opportunity was soon presented. A woman aged 52, came to the hospital with cirrhous cancer of the cervix and body of the uterus. "Hemorrhage was excessive, pain of the back and abdomen agonizing and cancerous cachexia well marked. The patient evidently had not long to live. In such a case it seemed justifiable to attempt to relieve the sufferings of the patient, even if the remedy should produce unfavorable symptoms, or should prove of no avail. I therefore prescribed Chian turpentine, six grains; flowers of sulphur, four grains; to be made into two pills, to be taken every four hours. No opiates were prescribed nor lotion taken. No change was to be made in her diet or occupation. On the fourth day after taking the medicine the patient reported herself greatly relieved from pain, and was in better spirits, but she complained of a large amount of discharge. It was feared that she referred to a discharge of a sanguineous nature. On examination, however, the vagina was found to be filled with a dirty-white secretion, so tenacious as to be capable of being pulled out rope-like, and this, although she had syringed herself three hours previously.' The medicine was continued for 12 weeks with excellent results and every appearance of a cure being probable. At the end of that time she suddenly left the town and left no address.

The second case was that of a younger woman, aged 31. In this instance the cancer appeared to be melted away by the turpentine in four or five weeks.

Mr. Clay reports several other cases in which remarkable benefit evidently resulted, with every prospect of permanent cure. Some cases have been cancer of the breast, abdomen, etc. In a case where the turpentine could not be digested in pills, it was made into an emulsion by Mr. Whinfield, dispenser to the hospital, as follows: An ethereal solution of Chian turpentine was prepared by dissolving 1 oz. of the turpentine in 2 oz. of pure sulphric ether, (anæsthetic). The ether dissolved the turpentine instantly. Of this solution, ½ oz.; solution of tragacanth, 4 oz.; syrup, 1 oz.; flowers of sulphur, 40 grains; of water to 16 oz.; 1 oz. three times daily.

Mr. Clay remarks that "ordinary oil of turpentine, if it produces any effect on cancer, is inadmissible on account of the speedy production of its specific effects, even when administered in small doses. The same remark applies with less force to the Venice and Strassburg turpentines; in my hands they have not produced the same beneficial effects on cancerous growths as the Chian turpentine has done. The maximum dose of the last named drug, which can be safely and continuously given, is 25 grains daily. It is advisable to discontinue the remedy for a few days after 10 or 12 weeks' constant administration, and then to resume it as before. The combination with sulphur was given at first, and has been continued. It is doubtful whether much benefit is derived from the combination, but the effects have been so uniformly good with it, that it was thought advisable to continue its use. There is every reason to believe, from the trials made with other substances in combination with the turpentine, such as carbonate of lime, iodide of calcium, ammoniated copper, quinine, bebeerine, hydrastin, etc., that the turpentine is best administered simply, as the most marked and rapid effects have always been manifested when it has been given alone.

"The turpentine appears to act upon the periphery of the growth with great vigor, causing the speedy disappearance of what is usually termed the cancerous infiltration, and thereby arresting the further development of the tumor. It produces equally efficient results on the whole mass, seemingly destroying its vitality, but more slowly. It appears to dissolve all the cancer cells, leaving the vessels to become subsequently atrophied, and the firmer structures to gradually gain a comparatively normal condition.

"It is a most efficient anodyne, causing an entire cessation of pain in a few days, and far more effectually than any sedative that I have ever given. In the cases I have described no sedative was employed in any instance, although in some cases where great pain had existed previously to commencing the treatment, large doses had been given. Whether this arrest of pain arises from the death of the tumor, or, as my son suggests, is due to there being no longer irritation of the sentient nerves (in consequence of tension being withdrawn by the removal of the cells), the fact is the same."

The "Chian" turpentine, above alluded to, is obtained from the *Pistacia Terebinthus*, a native of the small island of Scio, off the coast of Asia Minor. It occurs but rarely elsewhere, and the annual product of the tree is very limited. Hence this special turpentine is very rare, commands a high price, and is often adulterated with other turpentines. Chian turpentine is a thick tenacious liquid of a greenish yellow color, with a peculiarly penetrating, but quite agreeable odor. We understand that all the Chian turpentine in this market is just now in the hands of one party; but an additional and general supply will soon be received.

We further understand that the earnest attention of physicians in San Francisco and vicinity is already being turned to this supposed specific for a dreaded malady, and that treatments in one or two instances have been initiated with most favorable indications. We shall watch the progress of this same, and report results in these columns.

DIMPLES TO ORDER.—A New York paper heralds a manufacturer of dimples, who comes from Paris, of course, and whose *modus operandi* is described as follows: "I make a puncture in the skin at the point where the dimple is required that cannot be noticed when it has healed, and with a very delicate instrument I remove a slight portion of the muscle. Then I excite a slight inflammation, which attaches the skin to the subcutaneous hollow I have formed. In a few days the wound—if wound it can be called—has healed, and a charming dimple is the result."

SLEEPING IN STORES.—The *American Grocer* sensibly objects to persons sleeping in stores. The store may be clean and well kept, yet these things combine to make an impure atmosphere, which even a tolerable ventilation will not do away with; even a tolerable ventilation most country stores don't have. "We tested the matter for several years, and don't think our health was at all improved by the experiment."

HEALTH IN GREENHOUSES.—Dr. J. M. Anders in a paper in the *Medical Times* on the hygienic and therapeutic relations of house plants, asserts that plants are not injurious, but quite the contrary, and that persons accustomed to the moist air of greenhouses, are not, as a general rule, short-lived or consumptive.

Business Announcements.

Dividend Notice—Eureka Con. M. Co.
A Card—Philip Hinkle, S. F.

The Week.

During the week the accustomed and agreeable summer temperature has prevailed in the city and throughout the State. There are reports of damage by the hot and dry north winds to the wheat in some sections; many luxuriant fields were shrivelled or dried up; and in Colusa county particularly the yield of wheat will be materially reduced. On the whole, however, the crop will be large.

Mining continues active, as our reports from every direction clearly show. The mining situation in this State has not been so cheering for years. Our exchanges report continued activity in Arizona. The difficulty with the miners at Leadville, Col., has been settled and quiet restored.

It will be seen from the list printed in another column that Congress, which adjourned on the 16th inst., passed liberal appropriations for California. At the same time it is to be noted that many bills of great private and public interest were laid over for the next session.

Prof. James B. Angell, U. S. Minister to China, has arrived in this city. Of course he will have an opportunity during his brief sojourn of seeing, in a nutshell as it were, the practical evils of Chinese immigration. Even one day passed in the Chinese quarter will disclose to an observant eye the pernicious tendencies of the Chinese system.

The condition of the mining share market and the shipments of bullion are detailed in the usual column.

RICHMOND CON.—The London *Mining Journal* May 22d, says: The usual telegram from the mine at Enreka, Nev., states that the week's run was $70,000 from 1,000 tons of ore. During the week the refinery produced dore bars to the value of $50,000.

THE North Bloomfield hydraulic mine, Nevada county, is making regular shipments, which go to Nevada City under armed guard. This mine yielded over $300,000 last year, but this year the weather was so bad that the yield will not be quite as heavy.

The Iron Industry of the Pacific Coast.

The highly important iron industry—almost the highest in a civilized community—has been singularly neglected on this coast. It has long been known that vast deposits of iron ores of various and superior quality exist in California, Oregon and in Utah and Washington Territories, yet the first blast furnace for manufacturing pig iron has not been completed in California. Oregon has exhibited more enterprise. In 1865 the Oregon Iron Co. was incorporated to carry on the business of smelting iron ore and manufacturing pig iron; and the company built its first blast furnace at Oswego, on the Willamette river, a few miles above Portland. The furnace was finished and the first pig iron produced in 1867; and the furnace continued in blast 410 days, during which time 2,395 tons of pig iron were manufactured. This first investment proved unprofitable, and the works were sold to the Oswego Iron Co., incorporated in 1868. The works were remodeled in 1878-9, and the new company went into blast April 23, 1879, and is still in blast. Up to January 1st, it had produced in 206 running days, 2,300 tons of pig iron, an average of over 11 tons per day. The company intends to increase its capacity of production to 18 tons daily. It owns fully 2,000 acres of land, which include the Prosser ore-bed with its inexhaustible supply. This ore is of the variety known as brown hematite, and averages 40% metallic iron. At the close of last year the company had mined 8,000 tons of ore, and had 7,000 cords of wood made into charcoal; this year it has contracted for the delivery of 12,000 tons of ore and 12,000 cords of wood to be made into charcoal, and expects to produce 5,000 tons of hot-blast charcoal pig iron.

These facts respecting the infancy of the Pacific coast iron industry were gleaned from the *Commercial* (Oregon) *Reporter*, and redound to the credit of Oregon enterprise. Interest in the great product has been awakened at last, and has assumed practical form in this State. Lately the Placer *Herald* gave an interesting statement of the immense deposits of iron ore which occur near Clipper Gap, in Placer county, only a few miles from the Central Pacific railroad. It appears that at different times and by different parties efforts were made to secure the erection of furnaces to work the ore and produce pig iron, but they invariably proved abortive. At last a gentleman named Fitzhugh, who possessed large experience as proprietor of smelting works at the East, acquired an interest in the deposits at Clipper Gap, and has since labored assiduously to organize a company of capitalists to utilize the ore, and manufacture the indispensable iron. Success at last crowned his persistent efforts, and a company has been organized consisting of Egbert Judson, Irving M. Scott, A. P. Hotaling, and P. Fitzhugh, the latter gentleman acting as Supt. The *Herald* says the company has begun the erection of furnaces, and all the other necessary works for the production of pig iron, and expects to be in blast before the close of the present year. Near the mine a small town has been laid out, and a number of small cottage houses for families have already been built, and a large two-story boarding house, with a capacity to accommodate 30 men, is now in course of erection. Bricks are being made on quite an extensive scale for the walls of their furnace works, and the construction of patent charcoal kilns, of which latter they will require a great many. A large force of masons and helpers is at work on the foundation for the furnace, and the foundation of the structure that is to contain the works, engines and machinery.

The blast furnace, in the course of erection, will have a capacity of 10,000 tons per annum. The company has bought a section of land, which includes the mine, besides about 6,000 acres of timber land on the Nevada county side of Bear river, from four to six miles distant from the mine. It is their intention at an early day to construct a railroad track from the C. P R. R. to their works, and then on into the region of their timber, the latter road to aid in obtaining their coal or fuel, and the former to facilitate the export of their product and the import of all needed supplies. The ore beds are vast, and wood for charcoal and limestone for flux are both convenient and superabundant.

This Clipper Gap enterprise may be regarded as a substantial beginning of the iron industry in California. Indeed, the project may assume, in the near future, proportions of great magnitude. It is an open secret that, in response to an application from the Japanese government for a loan of $20,000,000, to construct a navy of iron steamships, several gentlemen, including Messrs. John W. Mackey and Irving M. Scott, offered to take the loan; that is to say, they offered to build a certain number of vessels at a stipulated sum and deliver them to the government of Japan. The rumor further runs, that one of the gentlemen mentioned has already gone to Japan for the purpose of negotiating the loan in the manner indicated, and that if he shall be successful, he will go direct to Great Britain to inspect the great iron works and ship yards, and collect the best and latest data respecting the construction of iron vessels, and that on his return here the company will at once proceed to erect extensive and complete works for the manufacture of iron and the construction of iron steamships. It is stated that the parties own a large tract of land adjoining the present rolling mills, which they will devote to the purpose; and further, that the plant of the company, which will include a Bessemer converter, will be commensurate with its great capital. If this rumor should prove to be well founded, California may at a single bound take a place in the ranks of the iron manufacturers and iron ship builders, and use a part of her vast product of the precious metals to build up and foster the long-neglected industry. Iron ores occur superabundantly on the coast; wood is also abundant at many points; and if we shall be able to demonstrate that we can produce cheap as well as superior iron, what, it may be asked, is to hinder San Francisco from building iron steamers and ships for the trade of the Pacific, as the Clyde does now for the trade of the Atlantic?

Arizona.—No. 8.

Chief among the mines of Pioneer district is the Silver King, located in 1875. During the first nine months after its discovery it produced ore netting $90,000 and in 1876 it yielded $140,000, while for the first four months of 1877 it produced $127,691. Over 300 tons of ore averaging about $1,100 per ton have been shipped from the mine and the average value of the ore produced will not fall far from $100 per ton. The lower grades are concentrated and in that form shipped abroad. These concentrations range from $1,500 per ton upwards.

Other mines in the Pioneer district are Upper Crust, Silver Cross, Idlewild, Cedar Hill, Aztec, Glasgow, Montezuma, Baltimore, Ohio, 76, Athens, S. B. Farnham, Silver Belle, Silver Queen, Argo, Crown Point, Belcher, Surprise, Essex, Empire, Hartford and Wana Whats. A hatch of ten pounds weight from one of these mines yielded eight pounds of pure silver. Picket Post, called also Pinal, is a growing and thrifty town, 30 miles from Florence, and five from the Silver King mine.

East of the Pioneer district is the Globe, a region more than twenty miles square, the greater portion taken out of the White Mountain Indian Reservation. Among the principal mines are the celebrated and highly productive Stonewall Jackson, also the General Lee, Hannibal, Gleason, Henry Clay, Magnet, Champion, Miami, Chromo, Wheatfields, Irene, Buckeye, Dauuhe, Mexican and Excelsior. The ore of Stonewall Jackson mine is native silver and chloride silver, in a gangue of quartz and crystallized feldspar. The mines of the Globe district are said to be of the same character as those of the great producing mines of Mexico. Globe City in 1877 had five stores, two quartz mills, several saloons, and a population of about 300. About 20 miles from Globe City is McMillenville, containing about 200 people. It takes its name from the discoverer of the Stonewall Jackson mine which lies adjacent and which supports the business of the settlement.

In Randolf district, west of Pioneer district, are situated the Sky-blue and Hidden Treasure mines, and in its southern portion are some placer diggings. News from the Globe district, Feb. 7, 1880, is to the effect that a large body of ore, probably at least 68 feet wide, has been discovered at the Mexican. In the Richmond Basin, Globe district, are some first-class mines, among them the noted Mack Morris mine, which recently changed hands and is now being worked on quite an extensive scale. The veins here lie in a formation of gneiss and are remarkable for the richness of their ores, which are antimonial sulphurets. In this basin are also found "blanket ledges" or *Planchas la Plata*, and in the surface soil have been found great quantities of silver nuggets almost pure and much extremely rich float rock, which has generally been supposed to have come from the Richmond, Mack Morris and other rich deposits in places above.

Up to Jan., 1874, American mining capital in Arizona had never paid expenses. It was at this date that some of the mines in northern and central Arizona were discovered, among them the Stonewall Jackson, which was sold for $120,000. No sooner had it been sold than the owner heard that those who bought would have given $250,000 rather than not obtain it.

The climate of this mining region is good, work involving no loss of strength or appetite, and the country around is adapted to agriculture, so that milk, butter, melons, vegetables and fresh meat are readily obtainable at Globe City.

Mohave.

Mohave county occupies the northwestern angle of the Territory, north of Yuma and west of Yavapai. It contains no large town, but has several flourishing settlements and a considerable number of mines. Mineral Park, the county seat, in the Hualpai district, is a bustling little place, and at Cerbat, seven miles south, some milling is done. Aubrey, situated at the junction of the Colorado with the Bill Williams Fork, had a population of about 200 in 1877, and Hardyville, 70 miles north of Aubrey, also on the Colorado, was of about the same size. Aubrey is about 60 miles from Ehrenberg, Yuma county.

The Hope, Aubrey and Owen's mining districts occupy a large area north of the Bill Williams Fork. Here is the Omega mine, and northeast of Aubrey, about 45 miles distant by the road, are the McCracken, Senator and Signal mines. About 10 miles east of these mines, within a short distance of each other, are located the three settlements of Signal City, New Virginia and Greenwood. A short distance northeast of these towns is the Greenwood district, in the Aquarius mountains, 17 miles square, containing the Burro and Centennial mines. West of the Greenwood district, and northwest of the McCracken mine, is Cedar Valley district, of slightly larger size, and containing the Arnold mins, on a ledge several miles in length. Around the McCracken there is plenty of mesquit, ironwood and cottonwood; while water is supplied to the mills at Signal City and New Virginia by the Big Sandy branch of Bill Williams Fork.

The poorest ores of the McCracken run about $55 per ton, which is $10 more than the Comstock. The ore body is 45 ft. wide. Virginia City and Signal claimed a population of 600 to 700 in 1878. The Maynard district, in Hualapai valley, contains the famous Hackberry mine, about 55 miles north of Signal City. The assays of the ore vary from $100 to $3,000 per ton. Much of it is free milling. Wood and water, grass and game, are abundant in this district.

The Hualapai district, 34 miles in length by an average width of 15, contains several well-known mines, the business of which centers at Mineral Park and Cerbat. Among these mines are the Index, La Porte, Oro Plata, New Year, Metallic, Accident, Lone Star, Keystone, etc.

Apache.

Apache, a large county of some 23,500 square miles, occupies the greater portion of the eastern part of Arizona, having a length from north to south of about 280 miles, and a breadth of 96 miles throughout the greater part of its length. At its northeastern angle a large reserve is set apart for the Navajo Indians, and a large portion of the Apache reservation is included in its southern portion. West of the southern extremity of the Navajo reservation are the fortresses towns of the Moquis, a small remnant of the town-building Indians who held the country before the days of the wild Apache.

But little mining has yet been done in this part of Arizona, the only district marked upon the latest map, that of Eckhoff and Riecker, 1880, being Clifton. Here are the famous Longfellow copper mines. A letter from Clifton, dated Jan. 20, 1880, states that a more thorough prospect of the district shows that gold and silver abound here as well as copper. Silver appears to predominate, but portions of gold rock have been taken out. The amount of copper here is enormous. The Longfellow mine is not a vein, but an open quarry, copper extending in every direction. The Coronado mines, three miles to the west, are on a vein from 30 to 135 ft. wide, and show for a great distance. The copper is sent to Baltimore, and costs only five cents per pound to mine and smelt, and six cents for transportation by mail routes and railroad from Colorado.

Although only the greater part of the Apache reservation is in Apache Co., the agency and sub-agency are both on the south side of the river. The Chiricahua Apaches are said to be working hard under difficulties caused by a lack of utensils, etc., at irrigating and cultivating their fields. They have many sheep and cattle. Eskiminziu, their head chief, has 200 sheep and 60 cattle. If it were not for the sake of his people, the chief would take up land like a white. Polygamy is practiced, but is becoming rarer through white influence.

The Apache, whose name even now recalls images of rapine and murder, and who now is giving trouble to Uncle Sam's troops, who have to follow Victorio's band in and out of Sonora, Mexico and Arizona, is of medium size, physically quick and active, and capable of enduring great hardships. He is shrewd, can talk well, is witty and jocular, and exceedingly quick of movement. Cochise was the greatest warrior chief the Apaches ever had, and was never beaten in battle. After fighting the whites all his life, in 1875 he died a natural death. During the last three years of his life he lived at peace with the people of Arizona, but carried on a relentless war with the Mexicans. The Apaches on the reservation are kept in order by policemen appointed from among themselves, and these do their duty well and faithfully.

There are very few settlements in this county, the principal being those dignified with the names of Sunset and Snowflake "cities;" St. Joseph and St. John, all in the valley of the Little Colorado, which is fast settling up, and becoming important as a grain and grazing country. Heavy snow falls in winter, and, as in the rest of Arizona, rain falls in summer.

DEATH OF CONRAD WIEGAND.—The sad news comes from Virginia City of the death of Conrad Wisgand by his own hand. The death of his only daughter about three years ago, gave him a shock from which he never recovered; and that event coupled with reverses in business, so impaired his health and unhinged his mind, that at last he sought refuge from his woes in death. Mr. Wiegand was a native of Pennsylvania. He came to this city at an early period, and for several years held the responsible position of chief assayer of the U. S. mint. He then removed to Virginia City, where he established and carried on an assay office up to the day of his death. He was intelligent and versatile and a facile writer, and during his long residence on this coast was conspicuous for his ardor in the promotion of mining and scientific progress. Although somewhat eccentric, he possessed sterling qualities. He was sensitively honest, faithful in all his relations, and generous to a fault.

Devices for Grasshopper Killing.

There is danger that the grasshoppers from the mountain valleys may extend their ravages into the larger agricultural regions of the State, and means for destroying the insects are of general interest. We show some of the means for destroying the insects as laid down in the report of the Rocky Mountain locust commission. There are innumerable mechanical contrivances for this purpose. The cheapest and most satisfactory are those intended to hag the insects. A frame two feet high and of varying length, according as it is to be drawn by men or horses, with a bag of sheeting tapering behind and ending in a small bag or tube, say one foot in diameter and two or three feet long, with a fine wire door at the end to admit the light and permit the dumping of the insects, will do admirable work. The insects gravitate toward the wire screen, and when the secondary bag is full they may be emptied into a pit dug for the purpose. These hagging machines will prove most serviceable when grain is too high for the kerosene pans, just described, and they will be rendered more effectual by having runners at distances of about every two feet, extending a foot or so in front of the mouth, so as to more thoroughly disturb the insects, and prevent them from getting underneath; also by having wings of vertical teeth, so as to increase the scope with as little resistance to the wind as possible.

Two important facts should always be borne in mind in using these hagging machines: 1st, that they should always be drawn, as far as possible, against the wind, if this be stirring; 2d, that in proportion as the insects and the grain are advanced in growth, and the former become predisposed to roost, in that proportion the machines will prove more serviceable at night.

Prof. C. V. Riley, chief of the commission, constructed a machine embodying the features already mentioned, and it answered the purpose very well indeed.

It is not patented, nor does the Prof. intend to patent it, unless it should be found necessary to prevent others from doing so. The machine operates upon the hagging principle. It is, briefly, a large canvas bag stretched upon a light but strong frame, and placed upon runners, which extend with curved tips a little in front of the mouth. The canvas is stretched upon the inside of the frame, thus making the bag smooth and even within. This bag has a mouth, *A*, 10 ft. long and 2 ft. high, and converges backward to a small box or frame, 1 ft. square, with a slide cut-off, *D*. This box forms the mouth to a secondary bag, *B*, 2½ ft. long and 1 ft. in diameter, which ends in a second frame having two short runners below it. There is a sliding door, *E*, of wire gauze in the end frame, and the secondary bag is strengthened by a couple of strips of leather connecting the two small frames. The machine is made to "take more land" by means of two right-angled triangular wings, *C*, about 6 ft long, that hinge to the upright ends of the large frame, in such a manner that the rectangle joins the upper corner of the frame. From the lower side of this wing are suspended a number of teeth, or beaters, which swinging loosely, drive the locusts inward. The machine is handled by means of two ropes hitched to the outer runners, or to the outer and lower side of the mouth of the frame.

On smooth ground the machine can be easily hauled by two men, but where the grass is tall and thick it pulls harder. The locusts, on hopping into the machine, soon reach the small back portion, enter the small bag, and are attracted to the rear end by the light which enters by the gauze door. When a sufficient number are thus captured the machine is stopped, the cut-off is slid down in front of the secondary bag, a hole is dug behind the machine, the bag tipped into it, and the insects buried. A strip of leather closes a slit through which the cut-off slips, and the main bag is made of dark cloth, while the secondary bag is white, so as by contrast to attract more thoroughly the locusts.

The advantages of this machine are that it requires no additional expense to run it, as for oil, tar, etc. It will catch the winged locust as well as the young, if operated on cool morninge and eveninge, and is adapted to almost all conditions of growing grain. The machine can be made for about $10, and perhaps less. In practice Prof. Riley found it best to draw the machine by hitching to the runners, and to brace the winge at desired angles, according to the strength of the wind, by means of two iron rods, as in the illustration.

In order to show how mechanism can be arranged for crushing locusts, and thus destroying them as fast as they are gathered in, we give an engraving of what is called the Flory locust machine, patented by a man of that name in Colorado.

The main feature of this invention is a revolving platform of heavy canvas or wire cloth, which runs between two horizontal rollers. Long arms reach forward, which support a revolving reel; from these arms downward extend sheet-iron sides, over the top a canvas covering; all so constructed as to form a large, wide mouth, into which the hoppers are driven by the arms of the revolving reel and carried between the two rollers and crushed. Horizontal strips running along the rollers serve to keep the rollers and platform clear of the crushed grasshoppers. The whole machine is supported on two main wheels about the middle, and two smaller ones in front. Extending back is a frame or cross-bar, to which one or two horses may be hitched to push the machine forward, or it may be operated by hand. The front of

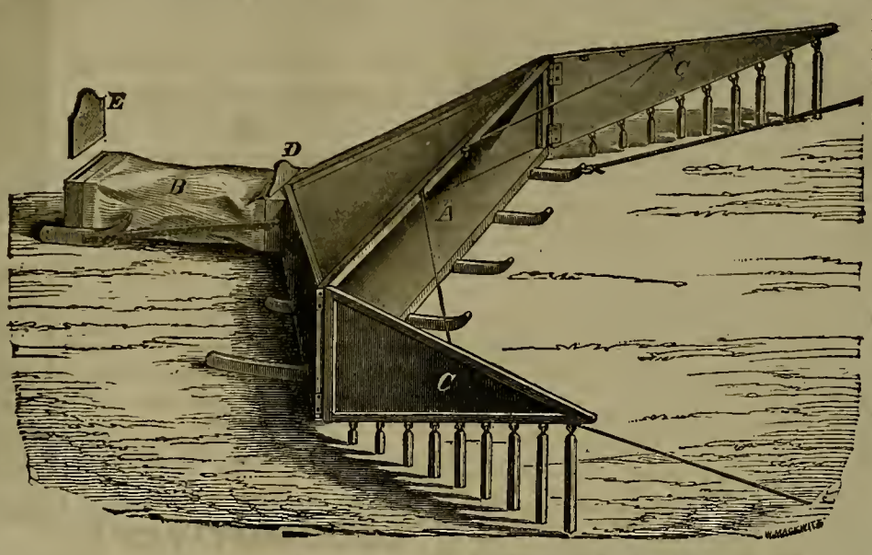

FIG. 1. LOCUST CATCHER, INVENTED BY PROF. C. V. RILEY, ENTOMOLOGIST.

the platform runs close to the ground, and by bearing down at the rear by the driver, it can easily be lifted over any obstruction that may be in the way. The machine can be raised or lowered in front to suit the crop over which it is run. This invention will destroy the grasshoppers without the necessity and expense of using oil or tar. The machine is so simple in construction that any ordinary workman can

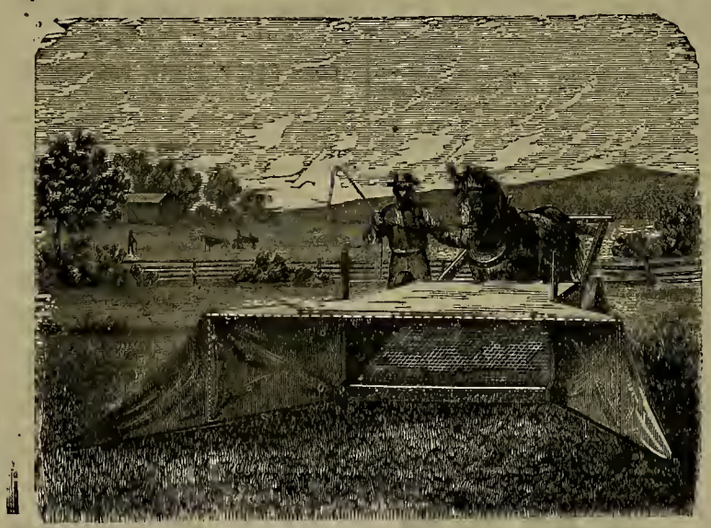

FIG. 2. FLORY'S LOCUST CRUSHING MACHINE.

put them up at a comparatively small price. The machine may be made of any size desired, from a small hand machine to a rod or more in width.

Fig. 2 represents a front view of this machine when in operation, and Fig. 3 a side view of the frame, of which the following is a description: The rollers, *B* and C^1, are 8 ft. between the side pieces. The roller, *B*, forming the axle, is

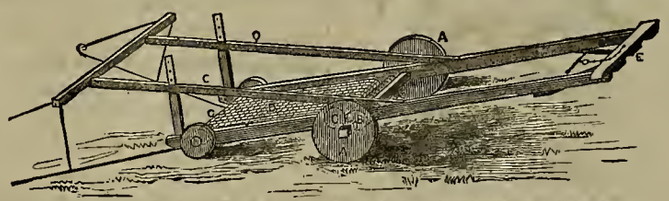

FIG. 3. DETAIL PLAN OF FRAME OF FLORY'S MACHINE.

about 16 inches longer than the other. The wheels are 24 inches in diameter, 4 inches thick, made of pieces of 2-inch lumber. Front roller, *C*, 8 ft. between side pieces, 4 inches in diameter. Front wheels 10 inches in diameter, so set as to let the front roller and platform run within a few inches of the ground. Front wheels should be on movable axles, so as to raise or lower the machine. The platform is made of heavy ducking, endless, and revolves between the two rollers, *B* and C^1. A bead block and key at each end is used to drive the roller, C^1, up tight against the axle, *B*. Side pieces are made of scantling 2 by 6, 7 ft. in front, 9 ft. in rear of axle. Arms, *G*, *G*, 2 by 2, so arranged as to raise or lower the cover, *P*. Cross piece in front of roller, *C*, (Fig. 3), set so close as to serve as a cleaner to the platform, also protects the platform from rocks, etc. A short apron is attached to this piece, extending to the ground. (If necessary, a cleaner-strip may be placed immediately under roller, C^1 (Fig. 3).) *W* are canvas wings, extending forward and ontward at an angle for the purpose of driving the grasshoppers in from either side; and as the machine advances, they jump on to the movable platform and are carried into the rollers, *B* and C^1 (Fig. 3), and crushed. *X*, *X*, are iron rods hanging by ropes from the end of front cross piece, *T*. *V*, *V*, are wires extending from end of iron rods to cross piece, *T*. To the iron rods and wire the canvas sides are sewed. An apron of canvas hangs from the iron rods, *X*, *X*, to sweep the ground. Over the top to the pieces, *C*, *C*, a canvas cover is placed, tacked on, extending back to the cross piece, *F*. The sides are also closed up with canvas.

We have given these designs in case any of our readers should come face to face with the grasshopper scourge, and desire to fight for the safety of comparatively small areas. Doubtless our ingenious readers can use the designs as suggestive for home-made machines, and perhaps improve upon the arrangements we have shown.

NEVADA REUNION.—The ex-residents of Nevada Co. will hold a reunion at Shell Mound Park on Saturday, June 26th. Blum's band will furnish the music, and then there will be dining, speaking, singing, poems, etc., to enliven and make pleasant the day.

SEVEN Puget Sound sawmills resumed operations, June 10th.

Collection of Mineral Specimens.

It is much to be regretted that steps were not taken by the State years ago to form a collection of mineral specimens. Collections of minerals are easily made, as from their nature they require no previous preparation, like most zoological specimens, and do not require careful handling. It was California's great mineral wealth that drew its population from all quarters of the world, and it is not to the credit of the State that, after over thirty years of mining, no creditable exhibit of ores and minerals exists within its boundaries. Had such a collection been commenced under the auspices of the State government any time between the years 1850 and 1860, we would now undoubtedly possess the finest collection of minerals in the world. There is no difficulty in gathering material for a collection of this kind. If a proper and permanent place be prepared for its reception and exhibitions, contributions would pour in from all parts of the State and the Pacific coast. It has always proved to be the case that collections of this kind grow as rapidly as room can be made for them.

The Australian Commissioner to the Centennial Exposition at Philadelphia brought with him a large and valuable collection of minerals from Australia and New Zealand to present to the State of California, but found on arriving here no place for it, and had to divide it up. A good portion of the collection now enriches the museum of the State University at Berkeley. In every town and village in the mining counties are private collections, many of them containing hundreds and some thousands of specimens. Many possessing duplicates would willingly contribute them to a State collection, and there are several no doubt who would give their entire collections if certain that they would be placed on permanent exhibition. The value of a collection of this kind to the State cannot be estimated, but it would be very great.

Owing to the indestructibility of mineral specimens, it is not yet too late to make a valuable collection. The last Legislature, realizing the necessity of such an exhibit, created the office of State Mineralogist, a part of whose duty it will be to obtain material for a State collection and take charge of it. Now that a permanent place is to be provided for the reception of specimens, if contributions from the private cabinets from all the mining counties, from new and old mines, be made now, more will rapidly follow, and a creditable exhibition of California's mineral resources will soon be made. We hope to hear in the near future of the legislatures of all of the States and Territories in the mineral-producing regions of the Union following the commendable but tardy action of that of California in this matter. It is a false and narrow-minded idea of economy that neglects such legislation.

THE CALIFORNIAN.—The bound volume which contains the first six issues of the new magazine, the *Californian*, brings indisputable evidence of the quality and style of the publication. It is worthy of the Pacific coast and should be liberally supported. The fact that the coming volume will appear in new dress is in itself an indication that popular interest is being secured. The *Californian* is credited with being edited with ability, and the group of contributors is a capable one. The magazine is characteristic of this coast. It has local ideas and glimpses at local scenes, both in nature and the associations of our people. Thus the publication has the freshness of the Pacific coast country upon its pages, and cannot but be agreeable to those who love the scenes and conditions in which they live and act. This freshness of its environment is reflected from the fabric of true culture and polite literature which occupy its pages. The *Californian* has lived long enough already to show that it is worthy to be loved at home and admired abroad, and this reception, we believe, awaits its coming issues.

MINERAL LAND BILL.—A bill for the survey and disposal of mineral land, framed and sent to Congress by the Public Land Commission, was reported to the House, June 10th, from the committee on mines and mining. The Pacific coast members do not favor the bill, and say that the bill agreed upon by them and reported from the same committee two months ago, has precedence on the calendar, and will be passed if any action at all be taken by Congress concerning mineral lands. The measure referred to, which was agreed upon by all the Representatives of the mining States and Territories, prescribes a general system of square locations, with the very important exception of all lodes which have a dip of more than 25° from the horizon, and also allows and protects locations of "prospectors' claims" (namely, where there are no surface indications) by giving citizens the right to hold a blind ledge by doing $200 worth of work upon it per annum.

IT IS stated that an offer of $700,000 was recently made for the Providence quartz mining property on Deer creek, Grass Valley, and was refused.

Foreign Coal Statistics.

An official statistical abstract has been published for the principal and other foreign countries in each year from 1866 to 1878, as far as the particulars can be stated, and this document contains a great deal of useful information. The statistics first give the principal articles imported into Russia, and show that of late years the importation of coal and coke into Russia has materially increased. In 1866 the amount of these imports was 39,683,000 poods, while in 1877 the amount was 90,367,000 poods. The valne of these imports was, in 1866, 1,984,000 silver rouhles, and in 1877, 12,989,000 silver rouhles. The figures show with sufficient clearness that during the last 12 or 13 years there has heen an important development in the import coal trade of Russia—a development, moreover, which appeare to have heen remarkahly steady and continuous. The next country to which the statistics refer is Norway, the imports of coals, cinders, and coke into that country being given with some particularity. In 1866 the amount of these imports was 1,739,000 tonder; in 1877 the amount was 4,110,000 tonder; and in 1878, 3,869,000 tonder. Here again an important augmentation is noted. Norway has recently required a much larger quantity of coals, although in 1878 there was a slight falling off as compared with the previous year. In 1878 there was also a diminution in the imports of iron wares into Norway. The imports of coal, cinders and coke into Sweden have greatly increased during the past few years. The total of these imports in 1866 was 17,487,000 cuhic ft.; iu 1877 the total was no less than 39,572,000 cuhic ft. These figures show, as will be perceivcd, that the imports of coal, etc., into Sweden, have more than douhled during the past decade, a fact which is certainly of some significance. The exports of ore, iron and copper from Sweden, show a slight falling off during the past few years, the amount in 1877 having been 298,000 centner, as against 648,000 in 1875. With regard to the imports of coal into Denmark, the official returns show that in 1867 the total was 2,873,000 tonder, and in 1877 4,783,000 tonder, another very material augmentation. The imports of iron and steel wares into Denmark have likewise much increased; hut with regard to the exports from that country, the statistics do not afford any information of interest to our readers. The quantity of coal imported into the German Empire in 1872 was 45,356,000 centners, and in 1878, 38,617,000 centners, thus showing an important decrease. The value of these imports was in 1872, 54,300,000 marks, and in 1878, 27,000,000 marke. On the other hand, the exports of coal from the German Empire have much increased during the last few years, the amount having heen in 1872, 76,395,000 centners, and in 1878, 116,506,000 centners. As showing the recent course of the German coal trade, these figures are certainly of great interest. The imports of coal into Holland have considerahly increased of late years; in 1866 they amounted to 1,579,000 tonnen, and in 1877, 2,425,000 tonnen. The value of these imports was, in 1866, 15,793,000 gulden, in 1878 the value had increased to 24,251,000 gulden. The exports of pig-iron from Holland have much increased; they amounted to 5,068,000 gulden in 1866, and to 21,119,000 gulden in 1877. The exports of coal from Belgium during recent years have not shown any specially remarkahle fluctuations. In 1866 the amonnt of these exports was 3,972,000 tonneaux, valued at 65,548,000 fr.; in 1878 the total was 3,889,000 tonneaux, valued at 53,396,000 fr. The exports of coke from Belgium amounted to 548,000 tonneaux in 1866, and to 576,000 in 1878. The imports of coal into France have not varied in amount to any great extent of late years. In 1866 the total of these imports was 7,408,000 tonneaux, and in 1878, 7,751,000 tonneaux; in 1866 these imports were valued at 146,500,000 fr., and in 1878, 143,100,000 fr. The imports of coal into Switzerland amounted to 346,000 zugthier lasten in 1866, and in 1878 to 649,000 zugthier lasten—a noticeahle increase. The importe of coal into Italy have also increased during the past few years. In 1866 these imports reached the total 524,042 tons, and in 1878 1,325,000 tons. In 1866 the imports of coal into the Austro-Hungarian Empire amounted to 5,737,000 centners, and in 1876 the total was 15,746,000 centners. The exports of coal from the Austro-Hungarian Empire amounted to 9,621,000 centnere in 1866, and to 27,348,000 in 1876. As will he perceived, these figures show a considerahle augmentation.—*British Mail.*

The Richmond Mine.

The London *Mining Journal* contains the report of the Directors of the Richmond Con. M. Co. (limited) at Eureka, Nev., for last year, from which we present the following interesting exhibit:

The mining profit for the year is $715,316.50, and the net profit is $672,558.75, or as nearly as possihle 50% of the total capital of the company. Out of this sum of $672,558.75, and a balance of $97,596, brought forward from last year's account, the Directors bave paid three dividends of seven shillings and sixpence each, amounting together to $303,750, and $7,022.50 legal expenses, at Eureka, in connection with the defense of the mine, leaving a halance to the oredit revenue account of $459,282. During the year 43,312 tons of ore has been smelted hy the two large furnaces; of which 34,371 tons were raised from the Richmond mine and 8,941 tons purchased, yielding (with 299 tons of fine dust and debris removed from the foundations of the old furnaces) 26,152 ounces of gold, 942,294 ounces of silver, and 8,172 tons of lead. In addition, furnace No. 4, which is working in connection with the refinery, has reduced (with the drosses from the refinery) 4,680 tone of low grade Richmond ore, and 4,228 tons of purchased ore, yielding 4,863 ounces of gold, 166,630 ounces of silver and 1,264 tons of lead. The total production for the year from all the furoaces is consequently 31,015 ouncee of gold, 1,108,921 ounces of silver and 9,436 tons of lead.

The huildings, furnaces, refinery, steam-engines, hoisting apparatus, and machinery of every description, have heen thoroughly maintained, $63,510.50 having heen expended on repairs and renewals during the year.

A large amount of exploratory work has heen done during the year, and the mine never looked hetter than it does at present; nor have there at any time before heen such large bodies of ore opened up; 10,816 ft. of drifts have heen rnn, 1,086 ft. of winzes, and 1,748 ft. of raises, making a total of 19,650 ft., or more than 2¼ miles. The cost of labor alone, in dead work, has heen $80,858.50. No. 13 chamher has heen developed on the 600 level, No. 14 on the 500, and No. 15 on the 400 level. This last chamher now shows the largest body of ore ever discovered in the mine. Connections, all the way in ore, have heen made from this chamher to the northward with No. 13 chamher, a distance of 380 ft., and with No. 14, also to the northward, a distauce of 500 feet, and to the eastward with No. 11, a distance of 180 ft. Ore has recently heen struck on the 200 main drift, and the indications are that it will open out to a large ore body and connect with the other chambers. Good ore has also been struck in a crosscut from the 200 main drift. A raise has heen started in the hack of the drift which connects chambers 11 and 15, and is up a total distance of 118 ft., in high-grade ore. The course of this raise corresponds with the ore found in the 200 level. All the chambers are looking well, and yielding large quantities. The grade of the ore ie improving, the average yield in March having been $56.37, and in April $67.50 per ton.

IRON SHIP BUILDING IN CHINA.—A significant sign of the times is the progress which iron shipbuilding is making in China. A Scotcb firm who hegan hy estahlishing ship repairing yards at Shangbai, several years ago, now employ 1,100 Chinese workmen.

MICA.—A deposit of mica has been discovered about three miles south of Skull valley, Arizona, which promises to be valuahle. At a depth of seven ft., sheets of clear mica, four inches square, are heing taken out, and the vein is increasing in size as depth is attained.

SACKETT

BOARDING SCHOOL FOR BOYS.

Fite Boys thoroughly for the

University of California, for College or for Business.

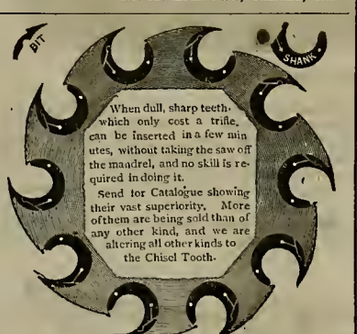
The hest Instruction is provided by Teachers of Experience and ahility.

Location most healthful and home equipment unequalled hy any Boys' School in the Scate.

For Catalogue, address the

Principal, D. P. SACKETT, A. M.

No. 529 Hohart St., Oakland, Cal.



BIT
SHANK
When dull, sharp teeth which only cost a trifle, can be inserted in a few minutes, without taking the saw off the mandrel, and no skill is required in doing it.
Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

Stearn's M'fg Co.'s Unequaled Pacific

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore hodies, etc., and will he of great interest and permanent value for reference. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, are sole ageuts for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the hook for their inspection.

INGERSOLL

ECLIPSE ROCK DRILLS.

The Best and Cheapest DRILL in the Market.

The Most Economical Air Compressore in the Market.

MINERS' HORSE-POWER.

One Horse can easily heist over 1,000 pounds at a depth of 500 feet. The Power is mainly huilt of wrought iron. The hoisting drum is thrown out of gear by the lever, while the load is held in place with a brake hy the man tending hucket. The frame of the Power is holted to bed-timhers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,

49 Fremont St., S. F.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Muley, jig, drag, circular, cylinder and hand Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of al U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid.

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia

March 10 1880.

A NEW BOOK.

A Treatise on the Horse and his Diseases.

By B. J. KENDALL, M D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the dosea, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines.

Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year.

It is printed on fine paper and has nearly 100 pages, 7½x5 inches. Price only 25 cents, or 5 for $1, on receipt of which we will send hy mail to any address,

DEWEY & CO.,

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:

Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

Metallurgy and Ores.

Nevada Metallurgical Works,

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.
(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

Scientific and Practical Books on Mining, Metallurgy, Etc.
Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.
This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.
This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.
It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus.
It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.
Price, $3.00 coin, postage free.

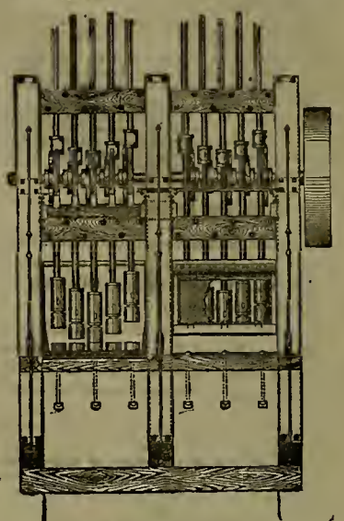
Certificate of Co-partnership
OF
GEO. SPAULDING & CO.

We, the undersigned, do hereby certify that we compose a partnership transacting Printing Business in the City and County of San Francisco, State of California, under the name and style of George Spaulding & Co. That the names in full of all the members of such co-partnership and their respective places of residence are as follows, viz.: George Spaulding, San Francisco; J. Munroe Miller, San Francisco; Dwight Germain, San Francisco.
In witness whereof we have hereunto set our hands and seals, this first day of May, A. D. 1880.
GEORGE SPAULDING,
J. MUNROE MILLER,
DWIGHT GERMAIN.
State of California, } ss.
City and Co. of San Francisco, }
On this twenty-seventh day of May, A. D. 1880, before me, Sam'l S. Murfey, a Notary Public, in and for the said City and County, residing therein, duly commissioned and sworn, personally appeared George Spaulding, J. Munroe Miller and Dwight Germain, known to me to be the persons described in and who executed and whose names are subscribed to the within and annexed instrument, and they each acknowledged to me that they executed the same.
In witness whereof, I have hereunto set my hand and affixed my official seal, the day and year in this certificate first above written. SAM'L S. MURFEY, Notary Public.
"Endorsed"—Filed, May 27, 1880.
WILLIAM A. STUART, Clerk.
By J. WHALEN, Deputy Clerk.

THE BEST NEWSPAPER FILEHOLDER AND ADJUSTABEL BINDER can now be had at this office. It consists of elastic fastenings, with stiff, cloth covered side. Size suitable for a full volume of this paper, $1. To our subscribers 75 cts., mailed postpaid.

Machinery.

GOLD AND SILVER
Grinding and Amalgamating
MACHINERY.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.
Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of
$2,550.
We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

The following Canadian patents have been issued to residents of the Pacific Coast:

10,869.—REAPER AND MOWER—D. B. Camphell, Palisade, Nevada. Jan. 22.

10,937.—SICKLE BAR FOR HARVESTERS—W. R. Whittington, Middleton, Cal., and W. S. Neale, Lakeport, Cal. Feb. 18.

10,947.—FURNACE—A. C. Tichenor, S. F. Feb. 21.

10,977.—CREAM COLLECTOR—P. G. Peltret, S. F. Mar. 1.

11,009.—MEASURING FAUCET—W. M. Sack, Oakland, Cal. Mar. 8.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

PNEUMATIC ANNUNCIATOR.—David and Theodore Morris, Market St., S. F. This device consists in attaching to the main compression cylinder a peculiarly operated check-bell or tell-tale, which is intended to indicate any leakage in the line of pipe, and consequent failure of the signal bells to sound. This check-bell is used in combination with the gong or bell-ringing cylinders in such a manner that it will ring when their bells ring, but will not do so when they fail to do so. Peculiarly operating valves in the pistons of the bell-ringing cylinders control the action of the tell-tale bell in such a manner that when these pistons fail to move properly, so as to ring the bells and actuate the valve, the tell-tale bell will not ring, nor will it when there is any leakage in the line of pipe.

AUTOMATIC CUT-OFF AND GOVERNOR.—C. V. B. Downing, 320 Sansome St., S. F. Patented May 25, 1880. No. 227,967. This invention relates to certain improvements in controlling the quantity of steam which is admitted to the cylinders of steam-engines, and it may also be applied to any engine which is driven by a vapor, gas or fluid under pressure. It consists in varying the size of the openings by which steam is admitted into the cylinder by means of a novel mechanism, which is so connected with the engine shaft, that the opening made by the valve in passing over the port is altered by the increase or decrease of the load upon the shaft, thus forming a cut-off and governing device, which is adjusted by the increase or decrease of the work.

BALING PRESS.—John Cook, Healdsburg, Sonoma Co., Cal. Patented June 8, 1880. No. 228,515. This press consists in the employment of a horizontal box having a follower operated by a peculiar windlass or capstan and ropes and pulley, which are placed along the sides of the box; and it also consists in a novel method of bolding and tightening the haling ropes while the follower is moving up, so that they are all ready to be tied when the bale is pressed. A lever is fitted to the press by which the bale may be ejected as soon as finished. This press is economically built and operated, and material is easily introduced, and bales removed without supplemental doors or severe labor.

MAGAZINE FIREARM.—A. Schneider, 24 Erie St., S. F. Patented June 8, 1880. No. 228,560. This invention relates to certain improvements in breech-loading magazine firearms, and it is especially adapted to be used in cases where the magazine extends beneath and parallel with the barrel of the arm. And it consists in a vertically-moving breech-block in combination with an operating lever, provided with means for giving the block an intermittent movement, whereby the breech-block is made to cause when opposite the barrel while the cartridge is forced home, the operating lever moving continuously.

PNEUMATIC RAILROAD SIGNAL.—D. and T. Morris, 1045 Market St. S. F. Patented June 8, 1880. No. 228,550. This device relates to the construction of the mechanical connections by which an air-compressor for supplying air for operating a semaphore signal is automatically operated by a passing train, and it consists in the peculiar construction of the mechanism operated directly by the train and connected to the piston of the compressor.

VALVE-MOTION AND CUT-OFF. — EUGENE O'Neill, S. F. Patented May 25, 1880. No. 227,918. This device relates to a novel mechanism for opening and closing the ingress and egress ports in an engine, and the combination of such mechanisms with a governor, so that the movements of the engine will regulate the amount of steam admitted to the cylinder by the direct action of the governor upon the mechanism. The governor may be of any of the well-known or suitable forms.

TURBINE WATER WHEEL.—Wm. Hecheney, S. F. The wheel is made in a frame so as to be easily portable, and is intended particularly for running with a small head of water, so as to utilize all the supply without waste of power. It has peculiarly-operating gates for controlling the admission of the water to the scrolls, and in a peculiar construction of the step or bearing for the reduction of wear.

HORSESHOE TOE-WEIGHT.—Wm. H. Hulings, Menlo Park, San Mateo Co., Cal. Patented June 8, 1880. No. 228,533. The shoe has a weight attached by means of a dovetailed shenk, fitting in a correspondingly shaped slot in the shoe and secured by a screw. When this weight is removed the shoe becomes a plain, ordinary shoe, with no projection or addition to interfere with the horse's action.

The Julian Mine.

This mine lies about one mile south of Newcastle on the line of the C. P. R. R. in Placer Co. The locations cover 2,500 ft. on a north and south ledge which pitches 85° to the east. The first work was done on the ledge in 1862 or '63. Some months since it was sold by A. H. Snabel to the Julian Gold Mining Co. The thickness of the vein is quite uniform, averaging about 30 inches between smooth grenite walls. It has been opened and prospected through several shafts and adits, now abandoned with the exception of the main shaft which has been run down on the ledge to the depth of 580 ft. Lateral drifts run north and south from the shaft at the 130, 230, 300, 400 and 500-ft. levels. All of the ground above the 400-ft. level bas practically been worked out and at present the ore is taken from the 500-ft. stopes. In the upper levels chutes of rich ore were found in the south drifts, but the lower levels have not as yet run into them. In the 500-ft. north drift chutes carrying a small per cent of galena have been cut through. The entire vein is stoped out and milled, for although the ore is low grade, it is very uniform in quality. No timbering except to furnish support for the men working in the stope is required, and except in the shaft and drifts no waste rock is taken out. The water in the mine is pumped from the 400-ft. level and is easily handled, about 30,000 gallons being raised daily. The ore is very easily milled, 20 stamps crush 50 tons of ore daily. The yield at present is about $4 per ton in free gold and 2% of concentrations worth $70 per ton. Four Frue helts are used for concentrating the battery sands and give perfect satisfaction, the tailings not assaying, except where galena is present in the ore, over 50 cts. a ton. The ore at present being milled is not as rich as that taken from the upper levels, but the ore at greater depths is of better quality. The hoisting and pumping engines are run by steam and the mill by water power. The number of men employed is 40, 30 of whom are miners. Mr. P. C. Du Bois is the superintendent.

The Julian is one of the mines of California which has a future. Its facilities for extracting and milling the ore are of the best description, and the quantity of ore very great. The sale and subsequent energetic development of the mine has attracted considerable attention and capital to the quartz mines in the vicinity, and a number of properties that have lain idle for years are being opened again and prospected with very encouraging results.

New Mining Districts.

We not unfrequently notice the names of newly established mining districts in our country exchanges. While many are in papers published in well-known mining counties, others are in journals from localities that cause us to give them more than a passing thought. By reading of these new districts we learn that the mining area of California is gradually extending year by year, and now embraces counties considered a few years ago unworthy the attention of the prospector. We learn that important mining discoveries have been made in the mountainous sections of counties hitherto considered wholly agricultural, and some of them promise in the near future to develop into important mining centers. The Sierras of southern California have been generally looked upon as anything but a land of promise to the miner, and were left for years to the flocks of the stock raisers of the "cow counties" for summer pasturage.

But gradually and unheralded, little parties of prospectors, the mining pioneers, made their way into these mountains and opened the sealed book. When word of their discoveries was first given to the public, others followed in their wake, and soon ledges were discovered, claims located and incorporated, and mining districts formed. Few of the lodes have been extensively developed yet, but assays of gold and silver have been obtained that warrant the outlay being made by some companies in preparations to work their mines. In some of the new districts arastras and small stamp mills have been erected, and ore worked with good results.

Thus we see our mining country increasing, instead of diminishing, in extent, and the good showing of these new districts, and the immense area of country yet unprospected, lead to the belief that California's mining history is only in its first chapter.

Railroads in Northern Mexico.

The people of Mexico have long opposed every attempt to introduce the railway into their country, believing that its introduction would be followed by an extensive immigration from the United States, and that American occupation would eventually result in annexation. For the same reason they have resisted the innovation of American ideas and capital in the development of their mining and other resources, and by their exclusiveness have greatly retarded commercial intercourse between the two countries.

Lower California and a large portion of the mainland of northwestern Mexico is almost wholly mountainous and has long been famous for its mineral wealth. Rich silver mines have been worked there for centuries and still employ the same primitive methods of the times of the *conquistadores*, when the ore was carried out in large bags of rawhide on the necks of *peons* and broken up by hand before being reduced. The only means for transporting freight being on the backs of mules over rough mountain trails, it is not surprising that no improvement has been made in the manner of working mines and reducing ores.

Two or three railroads from the Pacific States and Territories into Mexico are projected and the line of one—the "Arizona and Mexico"—has been laid out. The completion of these roads or any one of them will be the dawn of a new era for Mexico. The increased facilities for transportation would give an impetus to mining enterprise, and reinforced by American experience, eagacity, capital and improved machinery, her annual product of gold and silver would soon surpass anything chronicled in her history. The railroad would open up undeveloped mineral-territory, of which there is still a large extent in Mexico, and facilitate the development of mines in American territory through which it would pass. The route of the Arizona and Mexican railroad is located for a distance along the base of mountains upon which many of the principal mines of Arizona are situated, including the Tough Nut, Contention, Empire, Grand Central, Head Center, Tranquility, Sulphuret, Cincinnati, Girard, Lucky Cuss, Maimie, Owl's Nest, Minerva, Sultana, Bell, Randolph, Junetta, Sunset, True Blue, Gordon and others, so that each can dump their ores into cars on the track by the use of tramways, and have it taken direct to the platforms of the mills along the San Pedro river. An arrangement of this kind, enabling ore to be shipped from the mines at comparatively slight expense to mills situated in convenient localities, is what is needed in the wild inaccessible Mexican Cordilleras.

California Appropriations Passed.

At the session of Congress which closed June 16th, California was fairly successful in the matter of appropriations, although many bills of public and private interests failed to go through. Notable among the items in the appropriation bills are the following: Senator Farley's amendment to the River and Harbor bill, providing for a survey and calling for a report on the debris question; the increased appropriation for the Mare Island dock, which was urged and obtained by Senator Farley and Representative Horace Davis, and other items equally important. Davis' resolution, to secure the examination of and report on the tidal area of San Francisco bay, was also passed by the House. The bills which passed, and have been approved by the President, are Senator Farley's and Representative Pacheco's Catholic Bishops' bill; Representative Page's and Senator Booth's bill for the conversion of national gold banks; the bill for the repayment of purchase money, fees and commissions on void entries of public lands, and the bill allowing settlers who may hereafter settle on public lands, surveyed or unsurveyed, the same time to file a homestead application, and perfect the original entry as now allowed settlers under the pre-emption laws to put their claims on record, and opening to claim under the pre-emption and homestead laws of the first settlers who may hereafter settle on the same; and providing further that when a homestead or a timber-culture claimant files a relinquishment of a homestead claim, the land covered by it shall be open to settlement in the manner that it would have been though no entry under the homestead law had ever been made, and Senator Booth's and Representative Davis' bill to increase the pay of the Night Inspectors of Customs, and their bill authorizing the auditing of certain unpaid documents in the Indian Bureau.

The following Pacific coast items appear in the Sundry Civil bill, as passed by Congress during its last day. The other appropriations were passed as originally reported in the estimates: For the completion of the Appraiser's store in San Francisco, $35,000; completing the lighthouse and fog-signal at Tillamook Head, Or., $75,000; lightbouse at Point-no-Point, Washington Territory, $5,000; two assistant agents of the seal fisheries in Alaska, $2,900 each; traveling expenses for agents to and from Alaska, $7,770; for the protection of the Government's interests on the Seal Islands, $30,000; completing the repairs on the wharf and to continue the boring of the artesian well at the Benicia Arsenal, $10,000; continuation of the work on the dry dock at Mare Island, $112,500.

News in Brief.

EX-SENATOR JAMES A. BAYARD, of Delaware, died June 13th.

AT Brown Co., Texes, June 10th, four men were hanged for cattle lifting.

THE Riverdale irrigating ditch, Fresno, is rapidly approaching completion.

LARGE clams, weighing from five to eight lbs each, have been sold at Olympia, W. T.

A DISASTROUS fire-damp explosion is reported from a coal mine at Dortmund, Germany.

THE Mormon agent of immigration reports that Mormonism is largely on the increase.

ANOTHER duel was fought on the Belgian frontier, June 9th, between French journalists.

A CHINAMAN was sentenced at Yreka, Cal., June 8th, to 45 years' imprisonment in the penitentiary.

THE Dayton woolen mills, W. T., have resumed work with enough wool on hand to run them until fall.

FOR the quarter ending June 30th, the profits of the Western Union Telegraph Co. will be about $1,201,185.

THE Trustees of the San Jose Library Association have transferred all the property of the library to the city.

THE Boston firm of iron dealers, Hundlath, Elias & Co., failed, June 11th, with liabilities estimated at $750,000.

THE Western Union Telegraph Co., during nine days in June sent from Chicago a total of 354,965 words per day.

THE dory *Little Western*, with Geo. P. Thomas and Fred. Norman, sailed June 11th on a voyage across the ocean.

THE *Silver State*, Nev., reports that the railroad between Winnemucca and Wadsworth is literally lined with tramps.

WHILE thousands of men, women and children bathe in Great Salt lake yearly, accidents from drowning are unknown.

THE British troops have been ordered to withdraw from Cahul with the least possible delay compatible with their health.

JUNE 8th, was a great day at Milwaukee, Wis., the occasion being the Soldiers' reunion, 150,000 strangers being in the city.

R. R. DONNELL, the defaulting Assessor of Kern Co., Cal., was sentenced to the penitentiary for three years, June 11th.

AT Leadville, Col., June 13th, on account of the riotous disposition of the striking miners, Gov. Pitkin declared martial law.

THE people of Nevada City, Cal., are taking energetic steps to prevent the rebuilding of Chinatown within the city limits.

AT Sioux City, Iowa, June 10th, during a heavy storm, hailstones 11 inches in circumference fell and caused much damage.

A DISPATCH from Lacrosse, Wis., June 11th, says 5,000,000 ft. of loge, valued at $40,000, broke from the boom and were lost.

AT the National Convention of the Greenback Labor party at Chicago, June 8th, the opening prayer was enthusiastically cheered.

EX-GOVERNOR ALBERT G. BROWN, of Mississippi, was thrown from his horse into a pond near his home, June 12th, and drowned.

AT Leadville, Col., a vigilance committee, 3,000 strong, was organized, June 11th, to protect the working miners from the strikers.

GOVERNOR Perkine has appointed as Drainage Commissioners, W. F. Kuox, of Sacramento; W. H. Parks, of Yuba, and Niles Searles, of Nevada.

A NAVAL surgeon from new Caledonia told a French Legislative investigating committee, June 11th, that the convicts were poorly fed, and were cruelly treated with thumbscrews and the hastinado.

AN ILLUSTRATED HANDBOOK.—We have received from the S. F. News Publishing Co., a neatly illustrated handbook of Santa Cruz and Monterey, compiled by Mr. Henry Meyrick. A hasty glance will show it to be a bright and pleasant as well as an extremely useful companion. Its illustrations are light and breezy trifles, and inspire a disposition to cheerful fun. All the points of local interest in either Santa Cruz or Monterey, indeed everything that is attractive in those delightful watering-places, are given in agreeable detail. The brief history of charming old Monterey, with its exquisite scenery and delicious climate, is a bit of good reading. There are, besides, maps of both places. Everyone desirous of finding a piece of lovely and sheltered bay coast, will, we are sure, thank the compiler of this pleasant handbook.

A TERRIBLE CYCLONE.—A dispatch from Iowa, June 11th, gives an account of a terrible cyclone which swept over and devastated the southeastern part of Potowatamie county on the evening of June 9th. Wind clouds were observed to be forming both eastward and westward of Wheeling Grove, the place where the greatest destruction occurred. In a very short time the clouds formed a junction, and assuming a conical shape, came to the ground moving in an easterly direction. The path of the storm was not more than half a mile wide, but in its course everything was completely demolished. Houses and barns were lifted from their foundations and carried hundreds of feet and then dashed to the ground in fragments. From 15 to 20 persons are reported to have been killed, and a large number wounded, and others who were carried off by the fierce wind had not been found. The storm was unattended by rain.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of $1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to turn the hair gray, and either of them inclines it to shed prematurely. AYER'S HAIR VIGOR will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and humors. By its use falling hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on brashy, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft lustre and richness of tone it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

SAN FRANCISCO, May 25, 1880.

MESSRS. DEWEY & CO.—GENTLEMEN:—In acknowledging receipt of my two patents, I desire to express my thanks for the prompt attention which my business has received. The successful manner in which you have conducted the same shows a marked ability as Patent Agents, and I shall take pleasure in recommending your firm to all who desire to obtain patents. I have received copies of the MINING AND SCIENTIFIC PRESS containing descriptions of my inventions. With the best of wishes, I remain.

Yours truly, LOUIS BROON.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento valley. His advertisement appears from time to time in this paper.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

DIVIDEND NOTICE.

OFFICE OF THE

Napa Consolidated Quicksilver M. Co.

No. 330 Pine St., Room 16, S. F., Cal.

At a meeting of the Board of Directors of the above named Company, held on THURSDAY, June 3d, 1880, a Dividend (No. 10) of

10 Cents per Share

Was declared upon the capital stock of the Company payable on

Thursday, June 10, 1880.

WM. W. PARRISH, Secretary.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, Room 37, S. F., June 15, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, Dividend (No. 56) of Fifty cents (50c.) per share was declared, payable on SATURDAY, June 19, 1880. Transfer books closed until Monday, 21st.

W. W. TRAYLOR, Secretary.

DIVIDEND NOTICE.

Office of the Spaulding Gold and Silver Mining Company—A Stock Dividend has this day been declared, payable to the Stockholders of this Company, on and after the 10th day of June, of three shares of the Republic Mining Company's stock for each five shares of this Company's stock, on presentation of the certificates of stock of this Company.

JOHN HEIN, Secretary.

Office—117 Battery street, San Francisco, Cal. Saturday, May 29, 1880.

Spring Valley Water Works.

The Annual Meeting of the Stockholders

OF THE

SPRING VALLEY WATER WORKS,

For the election of Trustees for the ensuing year and for the transaction of such other business as may be brought before the meeting, will be held at the office of the Company on

WEDNESDAY, JUNE 16, 1880, at 12 M.

By order of the Board of Trustees.

WM. NORRIS, Secretary.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. P. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 29th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, May 21st, 1880, and day of sale to Wednesday, June 23d, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, June 24, 1880, and day of sale to Monday, July the 19th, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

Gover Mining and Milling Company.—

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Fifth day of May, 1880, an assessment (No. 42) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-first day of June, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the Fourteenth day of July, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office—402 Front street, room 8, San Francisco, California.

A CARD.

ELEVATOR ACCIDENTS.

On January 1st, 1880, the Cage of an Elevator built by me in Robert Sherwood's Union Block, and in the store occupied by Albert Mau & Co., fell and injured three persons who were upon it at the time. This is the first and last instance in which any person has ever been injured by any of my Elevators, and this would not have happened had not the machinery in the basement been tampered with, and the nuts changed on the end of the piston rod.

The Safety Arrangements on the majority of the Elevator Cages, as well as on those previously erected by me, will only act and prevent the cage from falling when the cage rope breaks. Should the machinery below give way, as was the case at Albert Mau & Co.'s and Bauer, Tobriner & Co.'s, the Cage must inevitably fall, with results probably more serious than the accident mentioned. Since then I have spent a great deal of time, study, labor and money to invent some positive safety, which I have at last succeeded in doing. I now place it before the public with the following merits:

I claim that it is light, simple, noiseless, durable and positively an absolute safety. They can be seen in operation at A. B. McCreery's Building, 310 Pine street; Robert Sherwood's Union Block, corner Market and Davis; Cyclops Machine Works, 115 and 117 Beale street; J. C. Johnson & Co., 12 Pine street, and several other places. The price each for them complete and attached to a Passenger Car, is One Hundred and Twenty-five dollars ($125); attached to a Store Cage, complete, One Hundred dollars.

Yours very truly,

PHILIP HINKLE,
116 & 118 Main Street.

We, the undersigned, Engineers and Mechanics, have made an examination of Philip Hinkle's Patent Safety Catch for Elevators, and find it to be light, simple, cheap, noiseless, durable, and a positive safety.

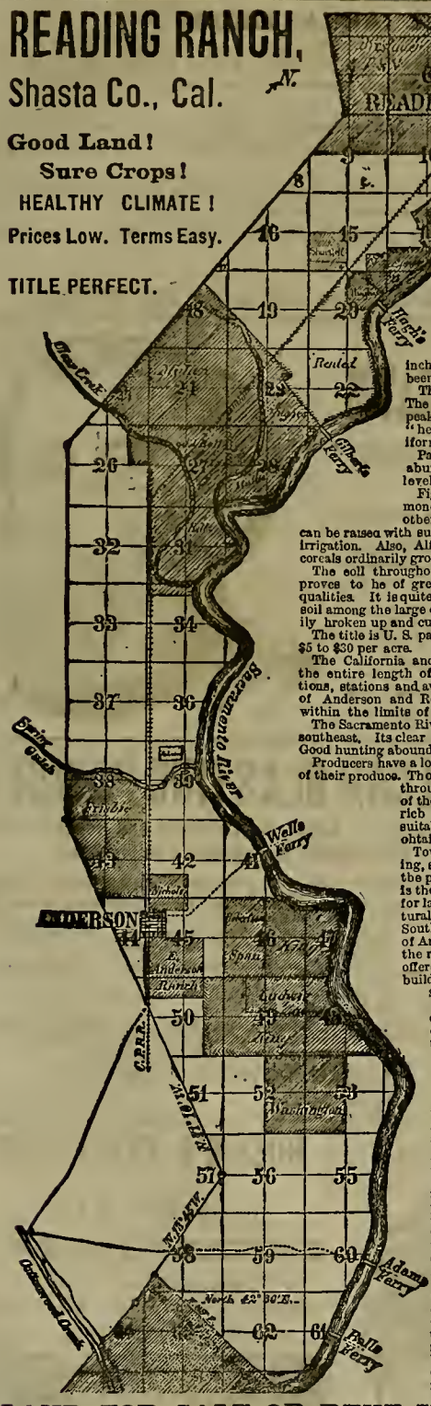
READING RANCH,

Shasta Co., Cal.

Good Land!
Sure Crops!
HEALTHY CLIMATE!
Prices Low. Terms Easy.
TITLE PERFECT.



The Reading Ranch, in the Upper Sacramento valley, originally embracing over 20,000 acres of choice grain, orchard and pasture land, is now offered for sale at low prices and on favorable terms of payment, in subdivisions to suit purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends over 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from dronth.

The climate is healthy and desirable. The near proximity of high mountain peaks give cool nights during the "heated term" which occurs in our California summers.

Pasturage, wood and good water are abundant. The tillage land is mostly level, with complete drainage.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract without irrigation. Also, Alfalfa, Vegetables, Corn and all other cereals ordinarily grown in the State.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The title is U. S. patent. Prices range principally from $5 to $30 per acre.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading, all of which are located within the limits of the ranch.

The Sacramento River borders the whole tract on the southeast. Its clear waters are well stocked with fish. Good hunting abounds in the surrounding country.

Producers have a local market, which enhances the value of their produce. The railroad transportation route is level throughout to San Francisco. A portion of the land is auriferous and located near rich mines now being worked. Land suitable for settlers in colonies can be obtained on good terms.

Town lots are offered for sale in Reading, situated on the Sacramento river, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

P. S.—Send postage stamp for illustrated paper containing information about Shasta county and these lands, and say advertised in this paper.

Location of Shasta County.

Shasta County lies not far from midway between the two most important ports on the Pacific shore, i. e., San Francisco and Portland, Oregon, and directly on the overland route, which in the future will become the grand thoroughfare from Mexico to British Columbia. The town of Reading, at present, and probably for years to come, the head of railroad transportation on the California side of the mountains intervening below Oregon, is distant from San Francisco by railroad (via Vallejo) 255 miles; from Sacramento City, 169 miles; from Marysville, 117 miles.

Persons thinking of buying or renting land will not likely regret a camping or excursion trip to this upper Sacramento country.

LAND FOR SALE OR RENT IN SUB-DIVISIONS.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.
An invaluable substitute for forgings or cast-iron requiring three-fold strength.
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.
15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over all other Steel Castings.
CRANK SHAFTS, CROSSHEADS and GEARING, specialties.

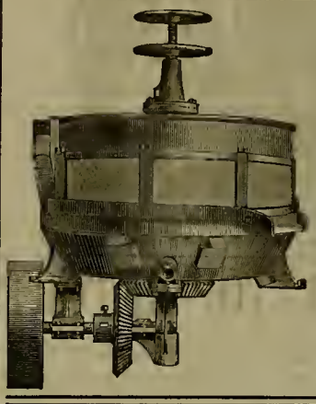
STEIGER & KERR'S
CONTINUOUS DISCHARGE AND GRINDING PAN.



This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The pan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

Gold Miners

WORKING PLACER, GRAVEL AND QUARTZ MINES,

SAVE YOUR GOLD!

— BY USING —

SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method. Thousands of orders filled and the demand constantly increasing.

Having very extensive facilities for the manufacture of these Plates, will fill orders for California, Colorado Montana, Dakota, Oregon, Idaho, Utah and adjoining States at prices which defy competition.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolnte certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves hy removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

THE NEVADA OVAL TOP RETORT.

The advantage of this Retort over the OLD FLAT PATTERN is, that it can he filled full of Amalgam, thereby holding more than the old style, hesides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can he driven in or out of place hy a single stroke of a hammer.

The Annoying Thumb Screw is Entirely done away with.

We Make Seven Sizes, as follows:

Numher or Pints.....	1	2	3	4	5	6	10
Holds Pounds Quicksilver	12½	25	38	50	63	75	125
Weight each..... 10 lbs	15	18	25	31	44	65	

Mortars and Pestles,

GROUND INSIDE.

Size—Quarts....	½	1	2	4	6	8	12	16
Hight—Inches..	37	5	6	7½	8½	9	11	12
Weight—Ponnds	6½	9	16	22	37	43	72	86

Bullion Ladle.

Forged from one piece of Charcoal Iron, eight inches in diameter hy four inches deep.

Send for Creulars and Prices.

VOLUME XL Number 26.

Pacific Coast Railroads.

A wondsrful activity in railroad huildiag is manifest in all of the States and Territoriss of the Pacific coast, aad the roads building and thoss projected, when completed, will tap all of the important miaing rcgioas in and wsst of the Rocky monntains. Should aothiag occur to dster work on any of thess roads, in a few ysars therc will hs a astwork of railways from the aorthern tsrritoriss of the United States to the City of Mexico.

Ths Atchison, Topeka & Santa Fe R. R. Co. has coastructed its road from Atchisoa, Kan., to Alhuqusrqne, N. M. Ths St. Louis & San Francisco Co. has hnilt a road from Pierce City to Wichita, Kan., where it connects with the Atchison & Topska railroad to Alhuquerque. From the latter place the St. L. & S. F. R. R. is being extended to San Francisco with all the rapidity possihls. The route follows near ths 35th parallel, through the northern portions of New Mexico and Arizona, crossiag the Colorado river ahout 150 miles north of Yuma. The Atchison & Topska railroad is hsiag pushed southwards towards Guaymas in Sonora on the Gulf of California on the ons hand, with a hranch line to the City of Mexico on the other.

The Southsrn Pacific railroad which is being prcssed forward through Arizona, will connect with the Texas system, and will also connect with ths A. T. and S. F. road whsre they cross sach other near the Rio del Norte, 200 miles sonthwest of Alouquerque.

Last wsek the steamer *Alexandria* sailed from New York for Mexico with a load of rails and cars for ths Central Mexican railroad, which is to be extended north from ths City of Mexico to the frontiers of the United States. A late telegram from Mexico says that 300 lahorers commsnced work on ths southern end of this road on the 25th nlt.

The Arizona & Mexico railroad Trausportation Co.'s road, will commence at Benson, whers the S. P. railroad crosses the San Pedro river, and follow np the river through s rich mining region to Sonora.

The Utah Southern Extension railroad, which it is designsd to extend through Colorado to connect ultimately with thc Atlantic & Pacific railroad is now in operation to a point in Nevada, within 75 miles of Pioche.

The Nevada & Oregon railroad is ths name of a proposed road to run from Reno, Nev., north through Lassen and Modoc counties in California, and up into Oregon. The money for the construction of the road is all ready and work will he commenced at once. The directors of the company are sx-Gov. Woods, John T. Davis, Mr. McMescham, Mr. Moore, Col. Ellis, T. Coffin and J. C. McTarnahan. A railroad is also projected to run south from Rsno to Aurora.

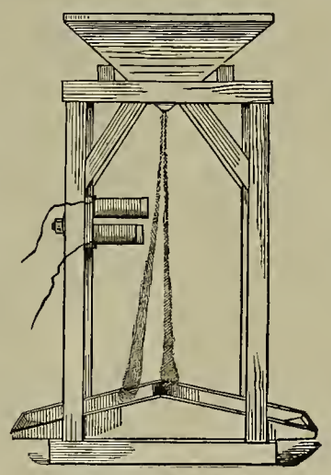
Other Nevada railroads that are being extended southsrly are the Carson & Colorado, on which work was hegun on the 31st ult., the Carson & Virginia now heing pushed forward, and which may eventually connect with the Utah Southern or Atlantic & Pacific, the Nevada Central (narrow gauge) in operation from Battle Mountain, 90 miles aouth to Austin, and the Palisade & Eureka (narrow gauge). The two last named are evidently looking to an ultimate connection with the Utah Southern.

In Oregon work is heing prosecuted on hoth ends of a railroad to run from Portland to the Dalles, and in the eastern part of the State, and in Washington Territory four or five surveying parties are in the field locating the routes of as many proposed roads.

Important Discoveries in Nevada.—Resently important discoveries were reported from the region of Walker river, Nev. Tin is aaid to have heen found hy a Cornish miner. At another point parties found a vein of quartz, which showed hoth gold and silver, hesides some other metal unknown to the finders. In the same neighhorhood aome prospector reports a small copper vein, in parts of which are streaka and pockets of native sulphur. Though copper is the predominant ore, there are also, hesides those specified ahove, ores of nickel, cohalt, lead, zinc and iron. Altogether the region is an interesting puzzle to the ordinary prospector.

Edison's Magnetic Ore Separator.

We give herewith an engraving illustrating the priaciple for the mechanical appliance of which Mr. Edison has rscently taken out a patent. Ths device is intended for tbe separation of the magaetic iron-sand from tailiags in placer diggings. The principle upon which it works will be rsadily scen hy examining the illustration. The concentration is effected hy allowing the sands to fall in front of the facs of a series of electro-magnsts. Ths magnstic attraction changes the trajectory of the falling magnetic sand without stopping its fall, so that while ths silicious sand, gold, and other non-magnetic suhstances fall straight down into one compartment of the rscsiving hopper, the trajectory of the magnetic sand is changed so that it falls into another compartment of the receiving hopper. By this means it is claimed that the separation of ths hlack sand is rapidly and completsly effected with the expenditure of vsry little lahor. Of coursa any numher of magnets of any practical power may he employed in addition to ths two shown. We presume Mr. Edison has expsrimented and determined hy actual test that a column of falliag sand may he thus separated without hsing drawn into



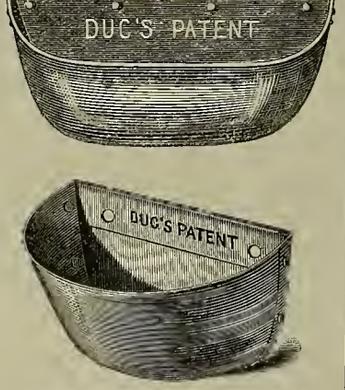
MAGNETIC ORE SEPARATOR.

actual contact with the magnsts. This ssparator could only he used in connection with placer diggings, as the amount of magnetic iron found in the tailings from quartz mills, except the ahrasions from the stamps and mortars, is harely appreciahle.

It is to the interest of evcry section of this coast that local papers should present important items and articles descriptive of their particular localities in such a way that they can he read intelligently hy readcrs at a distance; hut how often do we sce such items written in such a loose style that none hut residents of the vicinity can understand them! Editors should not forget that it is one of the principal functiona of a local paper to make puhlic to the "ontside world," the various resources and capahilities of their districts. Sometimes we read of a new mine that has heen discovered "on the mountain," or "on the fork"—of some stream not mentioned. Again we read that a mill is to he erected on a rich quartz ledge "on the divide," or on the "other side," and are left to draw our own conclusiona as to whether it is the "other side" of a river, range of mountains, mining district or county. Another paper informs us that "Mr. G. has located a claim on the aame ledge now heing prospected with such favorahle results hy Mr. D." Perhaps it is newa to some editors to know that the reason their exchanges do not puhlish the most important items, is hecause other editors do not wish to waste their space or their readers time on enigmas tbat present no possible means of solution.

The Duc Improved Elevator Bucket.

Ws hsrswith give a faithful representation of an improved elevator hucket, a device which is now vsry extsnsively used in a grsat varisty of manufactnriag enterprises. It is especially important to the manufacturers that the best and most reliahle construction of hucket shonld he employed, as hy disorder or hreakage much damags and delay is caused in stoppage of works, stc. Ths Duc improved hucket seems to combins every possible advantage attainahle. It is made in two weights, known as "light" and "heavy"—the former for light works, as for flour, meal, spices, etc., ths latter for heavy, as for handling coal, ores, sand, plaster, etc. This hucket is spherically shaped, so as to givs it the greatest possible strength, with ths least weight of metal. The principle of the arch is emhodied in evsry angle. This form also secures for it the greatest freedom and certainty in taking up and delivering its contents, as it is well known that a scoop can he handled much easisr than a square shovel, and there are no cornsrs in the former in which the material to hs elevated can "clog up." The Duc hucket is made of charcoal stamping iron, is struck out at ons operation with dies in 10 sizes—from 3½ to 10 inches. The two illustrations which we give will convey a very correct idea of its form. It is heing very generally introduced at the East for almost every description of business requir-



IMPROVED ELEVATOR BUCKETS.

ing such elevators. Mssrs. H. P. Gregory & Co., Nos. 2 and 4 California St., ars the agents for this coast.

Enlarging the Union Shaft.—According to the Virginia *Chronicle* of June 12th, the shaft of the Union Con. is to hs enlargsd from ths surface to the 1800 level hy the addition of a fourth compartment. Below the 1800 level there are now four compartments. In the new compartment there will he run a johhing cage, which will he used for carrying tools and all other articles up and down, and for doing all kinds of odd johs, hy which change the regular cages can he used without interruption for hoistiag ore. In enlarging the shaft it will he attacked in five different places. The drain tunnel, which leaves the shaft at a depth of 175 ft. helow the surface, will he utilized as a place of discharge for much of the waste rock that will he excavated in cutting out the new compartment. This improvement will increase the ventilation of the shaft and render it the most convenient and complete on the Comstock. Aa soon as the large pumps can he used down to the 2500 level the use of the donkey pumps run hy compressed air will he dispensed with, which will lead to a large saving in fuel.

As an evidence of the richness of Eureka's mines, says the *Leader*, we have only to refer to the El Dorado, on Prospect mountain. This mine, although not over 150 ft. down in the deepest place, has yielded, aince its location, in the neighhorhood of $500,000, and at present ia looking better tban it ever did.

Death of General Sutter.

The deatb of this distinguisbed man occurred suddenly at Washiagton on Friday, the 18th inst., at the advanced age of 77. Gen. Suttsr's life was more than ordinarily svsntful. Born in Switzerland, hs came to the U. S. in 1834, and shortly afterwards went to Missouri, where he manifestad that spirit of enterprise which characterised his lifs. Hs laid out a town, stores and mills wsre erected, and he eagaged in trading witb Santa Fe. Conceiving ths idea of fouadiag an Amsrican colony on the Pacific, hs organized a company and set out on his psrilous journey across the continent. He was hsset hy obstacles from ths first step, bnt his resolution was indomitahle. After months of delay, perplexity and fatigus, dnring which he attempted to reach San Francisco through Orsgon, the Sandwich Islands and Alaska, he chartsred a vessel at the latter plaes and reached the desired Yerha Buena, only to learn that it was not a port of entry, and that after rsplenishing the vessel's exhausted stores he must take his dsparture. The vesssl thsn sailed for Monterey, whsre Sutter was kindly recsived by Gov. Alvarado, who, learning of his project of fonnding a colony in the Sacramento valley, then filled with numerous trihss of hostile Indians, readily assigned him some 30 leagues of land in that and adjoining valleys. Gen. Sutter at once proceeded to ths sits of the grant, and sslected a point nsar the present city of Sacramento, whers he huilt a fort and founded the sttlement of New Helvstia. All this sounds more liks romancs than cold history.

With his charactsristic energy Gsn. Sutter huilt workshops and storss, and cultivated large tracts of land with the rude labor of the Indians, and later on hs had a launch running weekly hetwsen the fort and San Francisco. It was in carrying ont his enterprise of building a sawmill on the American river that two of his employees, Marshall and ths lad Weimar, picked up the piece of gold which lies at tbe foundation of the civilization of California. Gen. Sutter dispsnsed his hospitality with a fine courtesy; and no man, however humhls, lsft his door empty-handed or sorrowful. When the officers of the Government applied to him for sustenance for their men, Gen. Sutter slaughtered his herds and emptied his granaries, and it is said that up to the day of his death he was hopeful that his claim for remuneration would hs allowed and paid.

Gen. Sutter was rsmarkahls for ths swsetnsss of his disposition. One who met him frequently in the earlier days of California, says he nsvsr heard him uss an oath nor a foul word, and that he nevsr entered his workshops without raising his hat, and giving a kindly salutation to his workmsn.

Settlement with Government Timber Trespassers.—Dispatches from Washington are that the hill concerning timher-land trespasses, as finally agreed upon hy the Committee of Conference and passed hy hoth Houses Monday, contains Senator Farley's amendment extending its provisions to the Pacific States and Territories. It applies to all trespasses committed prior to March 1, 1875, and in regard to all of them it relievea actual trespassers from hoth civil and criminal responsihility, upon payment of costs of suits already commenced, and the suhmission of proof that the trespassers have auhsequently entered and paid the full Government price for the lands. The hill further provides that no civil suits shall he maintained for any trespass upon or on account of material taken from said lands, of the ordinary clearing of land, or of working a mining claim, or for agricultural or domestic purposes in maintaining improvements on the land of hona fide settlers, or on account of any materials taken hy any parson without the knowledge of the trespass, or without fraud or collusion hy any person who, in good faith, has paid the officers of the United States therefor. Suits for ahout $80,000 are now pending hefore the U. S. Court in Nevada for the value of timher cut from Government lands, and many othera are understood to be pending in California and various Territories.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Ed

Peru Mining District.

Editors Press:—The following items about minee due south of Bakersfield in the San Emidio mountains, the highest of that range which connects the Sierra Nevada and the Coast Range, and form the southern boundary of the great San Joaquin valley, are from authentic eources and may be of interest to your readers. These mines are in what is known as the

Peru Mining District,

Whicb takes its name from the principal creek in that locality. They are in the nortbeastern corner of Ventura county, their central point, Arastra flat, being about three miles south of the Kern county line, and 62 miles in a direct line south of Bakersfield, or about 65 hy stage road via Ft. Tejon. They are about the same distance west of Newhall, on the Southern Pacific railroad. The chief mines in the district are called the Bright Star, Monitor, Neptune, Mammoth No. 2, and Eclipse. There are believed to be at least two true fissure veins there. Frazier creek and ite branches drain the water shed formed hy the elopee containing these ledges. On this creek, south of these ledges, is Arastra flat, with its location for a future mill site (an arastra ie now at work), and tbe cabin of J. G. Parke, one of tbe principal owners in these mines, and who has given me most of the facts here presented. The altitude of this site ie about 5,500 ft. above sea level. The ledges above named are about 6,000 ft. above the sea, while etill higher up and about a mile and a half north of Arastra flat is the old Frazier mine, known and worked more or less at intervals since 1868. Its altitude is about 7,000 ft. The highest adjacent peak is about half a mile west of this old mine; it is called Frazier peak and its altitude was fixed at 7,750 ft. hy Lieut. Wheeler, who made it an important station in his Government survey west of the 100th meridian. This high peak stands near the 119th meridian. We ehould mention in tbis connection, that the bighest peak found in all this mountain range, according to Wheeler, is

Alamo Peak,

About six miles south of Frazier peak. Hie measurement showed it to be some 1,200 ft. bigher than the latter, or about 9,000 ft. altitude. Its name, Alamo, meaning poplar, is given from a number of mountaiu poplars growing near its hase. The ledges trend uearly nortb and south, and dip east from 30° to 35°. They vary in width from 2 to 12 ft. The country rock is granite, gneiss and talcose slate, with blue clay gouge, wet and putty-like, from an inch to a foot tbick, between the gangue and ledges. The nature of the quartz is free gold, ahundance of sulphurets, traces of silver and a copper stain. Several assays of the different ores have ranged from $12 to $130 gold, others higher, about 20% of the assay being silver. Although tbe elovenly and irregular mode of working the Frazier mine gave this district a had name at one time, that mine itself is known to he a good one, having yielded $100 per ton, when worked with very inferior machinery. It has a 10-stamp mill. Not only bas its bad management, in former years, injured the repute of the district, hut handitti have rohhed its hatteries on at least two occasions. To give an idea of its natural good quality, we can state the fact that its old tailings down the gulch, a mile and a balf helow it, are now heing worked with an ordinary rocker, and yield $6 to 40 buckets of tailings.

On Peru Creek,

A living etream that givee the district its uame, and which runs east and eoutheast into Santa Clara river, furnishing from 800 to 4,000 inches of water at different seasons of the year, are numerous ledges of silver, gold and argentiferone galena. A mile south of these galena ledges and on Peru creek, are five arastras now in successful operation, and six others in course of construction. The fall of Pern creek near these mines is about 230 ft. per mile, furnishing excellent water-power.

Near the fork of Peru and Lockwood creeks, about three miles southwest of the galena mines, are ahundant evidences of old placer mining done at least 30 years ago. It is thought they may have been worked even earlier than that hy the old Padres from San Gahriel Mission near Los Angeles, for the locality is only about 90 miles northeast of the latter city.

Mexicane and others are now working these placer mines with good results. The altitude of this junction ahove the sea is ahout 4,600 ft.

Evidences of Early Mining

By the Padres are, that in an old arastra, near Frazier peak, an oak ahout a foot in diameter ie growing, and several old smelting furnaces have heen discovered in Kern county, ahout eight miles further north.

Dr. W. B. Brink, of Bakersfield, who has had considerahle experience in mining and assaying, assures me that in 1869, a piece of eilver ore was found near an old arastra in that vicinity, which yielded by an assay he made $2,200 in silver to the ton.

Parties bave lately been diligently prospecting for the ledge from which this rich ore is supposed to bave come, and rumors, in which some credence is placed, have reached Bakersfisld that such a ledge has just heen found.

Dr. Brink has within a few days received from Peru creek several fine specimens of argentiferous galena, which he is satisfied will yield over $200 silver per ton.

The Supply of Timber

In the Peru district, which extends 20 miles north and south, and 12 miles east and west, is ahundant enough to last centuries for mining purposes. It consists not only of oake, hut pines and firs, from two to five ft. in diameter.

Great as is the altitude of this district, those who spent last winter there were hut little troubled hy the snow. Twice it fell at Arastra flat to a depth of three ft.; but it lay on the ground there only ahout 48 hours each time. On the higher peaks and ridges eome of it etill remains, and is yet visible—a most unusual occurrence—from Bakersfield and the surrounding country. That whole mountain region ie very healthy. Thc lowest temperature last winter was only ahout 20°, or 12° helow freezing.

Mr. J. G. Parke, former Surveyor of Kern county, and now U. S. Deputy Mineral Surveyor, extende

A Cordial Invitation

To mining experts and others who may wish to visit and examine this mining region, in which a general interest is deservedly increasing. His arastra in Arastra flat was completed last April to work orcs from the ledges of Frazier canyon. His location is about 13 miles south of Fort Tejon. The old stage road from Bakersfield to Los Angeles passes within six miles of his camp. From that there is a good wagon road to within two and a half miles of his millsite. He now has a sled road over that distance, and estimates that a good wagon road can be made over tbe two and a half miles for $500. Mr. Parke's address is Bakersfield, and he will gladly give further information to any who may wish to consult him hy letter.

An item of interest worthy of record here, is tbat

A Large Ledge of Good Lignite,

Or Coast Range coal, was found this spring on the Tejon grant, about 12 miles northeast of Fort Tejon. It is ahout four ft. wide and dips westward some 45°. It has heen used in a furnace on Tejon ranch, and burns like Kennol coal.

This "Peru mining district" is undoubtedly one of the most intereeting that are uow heing prospected and developed under the new impetus of mining in California.

Bakersfield, June 8th. J. W. A. W.

About Utilizing Tailings.

Mr. A. D. Ballard, at Silver City, says tbe *Territorial Enterprise*, has been exporimenting by a new process upou tailings. This process is euhstantially the same as working gold ore by amalgamating on copper plates. It is not generally believed that silver ores can be worked to any high percentage hy this method, though Mr. Ballard claims satisfactory results so far. Iu a camp like Bodie or the Black hills his process is worth close attention. Really, there is no further questiou as regards working Comstock tailings hut that of location, quantity and assay value. Unless tailings are rieh, and such were mostly worked up years ago, cheap power, large quantity and economical management are necessary. Tbere must he ample room for drying, and wood and water must he cheap. Along Carson river are all these advantages. The Lyon mill and mining company has worked from 2,000 to 5,000 tons of tailings per month for the last 11 years which could not have paid expenses in another location. This company has water power and manufactures its own bluestone. Its tailings are thoroughly oxidized hefore going to the mill.

The Atlanta property, at Johntown, ie now paying well, and will he likely to retrieve many of ite past failures. Thie is chiefly owing to the long time the tailings have been exposed to the action of the sun and storm, as the older the "reservoir" is the more freely it works. The parties now working the Atlanta will soon go for the large quantity of tailings in Washoe valley helonging to the Union foundry, and will hardly make any failure.

Tbe amount of tailings in this vicinity is large. At nearly every mill on the Carson river is a large reservoir, and on the Ophir flat, ahove Daytoo, are 500,000 tons. There are eeveral large banks about Silver City, and on the Parke property, Six-Mile canyon, is a hody second only to that of the Ophir flat.

The conditions are not favorahle for working all these tailings, hut witbin a year or two it is most likely that all will he in shape to afford some profit to the owners. Tailings which average $6 on the Carson will pay now, hut would not about Virginia City or in Six-Mile canyon as yet.

Among the most important improvements adopted latcly is that of preparing liquid copper solution and refining bullion on the premises, as tbis in many cases will alone make the difference hetween profit and loss.

It is best for all who own tailings that will not afford them any present profit, to wait patiently, for their time will come, and prove all the better for the waiting.

At French Gulch, Shasta county, one of tbe quartz miners crushed 2,500 lbs. of rock, a few days ago, and obtained 25 ozs. of gold.

The Gunnison Country.

A writer in tbe Lsadville (Col.) *Chronicle* gives a voluminous and interesting description of the Gnnnison country, whicb has lately attracted so mnch attention. Gunnison City, he says, is I93 miles from Leadville, and is reached by roads of every conceivable character leading over mountaine and across valleys innumerable. The altitude of this place is about 8,500 ft. The name Gunnison City is given to two towns, the old and new, probahly a mile apart and both are laid off—wide etreets and regular equaree and blocks, ae is the intervening space. In all, about 120 houses have heen erected, all small buildings, very poorly constructed, and almost unfinished. Lumher is an article nearly impossihle to ohtain. The only sawmill in the country is 20 miles up Lumher creek, and has only a 3,000 ft. per day capacity; house logs are an equal distance away and green. Sunhurnt hricke or adobes are used to eome extent. The Red Lion, a two-story hrick building is hnilt of them, partitions and all. Tents are used to poor advantage on account of the wind which hardly ever ceases to hlow a gale, chilly and cold from the immense fields of snow on either side. Along the banks of the Gunnison not less than 2,000 people are camped in tents, awaiting the melting away of the snow above.

Up to the time of the writer's departure there was bnt one game—keno—running, but he met two four-horse loads of gambling fixtures out from Buena Vista. Gunnison has a city government, a gentleman named Kubler wearing the Mayor's rohe. Ruhy Camp, the mention of whicb etrikes a chill to one who has been there, is 32 miles from Gunnison, up the river to the confluence of Ohio creek and up the Ohio creek to its very eource, which is hut 3 miles from Ruhy. All merchandise going into Ruhy breaks hulk at King's, and is transferred to the hacks of men who pack it across the snow for 7 cents per pound. Ahout 20 of these fellows are constantly employed. A road hae heen hnilt into Ruby, hut from 5 to 30 ft. of snow will bold it down until at least the 1st of June. There are three town-sites, Ruhy City, Irwin and Ruhy Camp. At the first named not so much as a cahin as yet gladdene the eye. On paper the streets are hroad and straight, with a plaza in the center of the town. You are told hy men interested that one block facing the plaza is reserved for McPherson's hank, that a portion of another will he used hy Mr. Langrishe for an opera house. The snow now levels the entire country.

About 400 locations have been made upon the mountain side flanking the town and around the lake. The same complications of claims exist as in any other place, and the same amount of litigation will be necessary to untangle them. The writer was ahle to find hut one man at work, and be in a tunnel about 20 ft., and thus far hut a prospect. The Forest Queen is the most talked-ahout in tbe district. It ie situated to the right of the lower town, and is opened hy a tunnel and sbaft, hoth filled with snow and ice. Something like 40 tons of ore were sacked and etowed away in a tent, from which a piece was taken at random, and assayed at random with the following result: 55½ ouuces of silver, $71.64. The ore was of the galena epecies, with white spar being attached in several places.

Good prospects have heen found in all of the districts, but nothing to raise more than a ripple of enthusiasm. The journey through the Gunnison suggests an idea to the writer that will do for the uninitiated to act upon, and may not please the class to which it refere, and that is a class of adventurous, cunning, smart fellows, "rustlere" they are called, who push into new territory, locate a townsite, get an elahorate mah, and hy everlasting chinning, secure a form for their town, sell lots, give away lots, ewap whole blocks for a etack of reds, any way to make a raise. Hundreds are fooled, a few hedge and get out, hut those least ahle to stand the loss are the dupes.

The Defiance district is at the headwaters of Roaring Fork, ahout 20 miles heyond the Ute reservation. The principal camp is known as Defiance City, at the confluence of Roaring Fork and Grand river.

The Roaring Fork mining district comprises that portion of the silurian or carhonate belt that cuts the Roaring Fork river in the vicinity of Maroon, Castle, Hunter and Woody cresks. The entire district, up to the present date, is but an enormous prospect camp. Ten ft. is the average depth of shaft right through all the claims. It is not, therefore, strange that theee surface assays should he on the average low.

The principal towns of the district are Highland, Roaring Fork City, Aspen and Ute City. Merchants have located at each place, and large etocks of merchandise are heing freighted in.

A Valuable Gold Vein.—The Gold Hill *News*, June 10th, saye that Capt. Kelly had just returned from a visit to the Victorine mine at Kingston, Lander county, 28 miles south of Anstin. The ledge is from 8 to 10 ft. in width, and has been uncovered hy a drift 70 ft. in length. It has taken what is eupposed to he its true course, and pitchee into the hill. Capt. Kelly took five samples, the assaye of which average $75. Nine-tenths of the metal ie gold and the other tenth silver. A mill has heen purchased and the reduction of ore will be soon commenced. Fifty men are employed. Tbe property is under the management of Edward S. Stokes, who is backed by Felton, the S. F. capitalist.

Calaveras and Tuolumne Mines.

For a long time, capital has been quietly seeking invsstment in the mines of Calaveras and Tuolumne, and large sums bave been expended during the past year in making the necessary preparations for active work on a large scale. Occasionally machinery goes forward from this city by railroad to Milton and to Oakdale, eome wholly new outfits, and other consignments only parts of mille for crushing rock, all going to show a steady purpose of development of quartz minee in the counties named. Capitalists do not usually invest in anything with a view of permitting their money to remain idle, and it is, therefore, reasonahle to expect some eort of an ontcome, at as early a date as practicahle, from the large investmente that have heen made within the last year or two in the mining range, from Mokelumne Hill, or the northern houndary of Calaveras, through the center of the latter county, acrose the Stanislaus, and embracing an extensive mineral area in Tuolumne county. Murphy'e, Douglase' Flat, Vallecito, and along south across the Stanielaus river to Columbia and Sonora in Tuolumne county, miners will he coaxing the precious metal from the earth and rock with picks, drills and giant powder, for a century to come. The region traced is probahly the richest mining territory within the limits of the State, and it ie only a question of time, and a very short time at that, when thousands, inetead of hundreds, of men, experienced, practical miners, will find profitable and permanent occupation in that section, build up homes, flourishing villages, school-houses, churches, and gather around them all the accompaniments and comforts inseparable from prosperity and a high order of civilized life. Many rieh minee that have long been owned and held hy individuals wbo have heen unahle to make any marked progress in the way of development, are either passing into the hands of capitalists or nnder the control of organized companies who propose, by united effort, to put their actual value to a thorough practical test. For that purpose the present season is particularly auspicious. The work that has heen quietly going on promises practical results this summer. Quartz crushing will he more lively henceforth, in the counties named, than ever before, and the hoom in placer mining tbis season is likely to exceed anything experienced in that line for many years. There will be abundant supply of water for hydraulic and other placer mining operations. Everything betokens the inauguration of a new era of mining industry in old Tuolumne and Calaveras counties, and with it will inevitahly come renewed prosperity in every other branch of local husiness.—*Stockton Independent.*

The Cortez District.

Cortez is one of tbe oldest mining districts in eastern Nevada, and for a numher of years nearly the entire mining operations of the district have been carried on hy Mr. Simon Wenhan, who has in a quiet way produced large amounts of silver bullion. Recsntly the Eureka *Sentinel* was informed that his principal mine, called the Garrison, looked better than ever hefore. He has now three eplendid honanzas, whereas he never had but one at any time in the past. All of these are large, and give assurance of hoth richness and permanence. The ore hodiee occur in the vicinity of the 300 and 400 levels. The ore of the Garrison has always gone extremely high, and the present reserves are as good as the best the mine has ever produced. A new tunnel has heen etarted to tap the mine helow present developments. The tunnel ie in over 300 ft. When completed it will greatly facilitate the extraction of ore, as the cost of hoisting will be therehy saved. It is in contemplation hy Mr. Wenhan to construct a new mill this eeason near the mouth of the tunnel. The cost of hauling and packing, which are important items, will also he saved. He thinks the condition of the mine will warrant the outlay for a new mill. The mill now used is situated ahout eight milee from the mine. A tunnel is likewise heing run hack of tbe residence for water to supply the proposed new mill. This tunnel has attained a length of ahout 700 ft. Should it fail to develop water, a eupply can he brought in pipes a distance of seven miles, at an estimated cost of 1,000 per mile. If the new mill is nndertaken, and there is hardly a douht that it will be, Cortez will he quite a husy little place in the near future, giving employment to quite a large force of men. Mr. Wenhan has built himself a eplendid residence within the past year, and is ae comfortahly situated as any man in Nevada. He is surrounded hy a most interesting family, and all are contented and happy, notwithstanding they reside in the wilderness. Mr. Wenhan has etuck to Cortez for tbe last 17 years, and richly deserves his good fortune.

Cost of two Tunnels Compared.—The acceleration and economy realized in the St. Gothard, as compared with the Mount Cenis tunnel, may he thus hriefly indicated: The latter, 12,233.56 meters in length, took 13 years and 1 month to make. The former which is 2,686.45 metere longer, only seven years and five months. The mean monthly advance in the Cenis tunnel was 71.551 meters; in the St. Gothard, 167.640 meters, or more than douhle. And the total cost of the St. Gothard will be ahont 25% to 30% less than that of the Cenis.

MECHANICAL PROGRESS.

Physical Changes in Iron and Steel.

At a recent session of the British Iron and Steel Institute, Mr. Thomas Wrightson read a paper entitled "Some Physical Changes in Iron and Steel at High Temperatures," in which he detailed a number of facts observed by him and bearing upon that much discussed subject, the floating of solid cast iron in liquid iron. Mr. Wrightson has constructed an apparatus, called by him the ovosimeter, for measuring the changes of volume in cast iron when passing from the liquid to the solid state. He found that, while cooling from the liquid to the solid state, cast iron expands as much as 0.51% lineally, which is equivalent to an increase in volume of 1.53%. Again, in contracting from its maximum volume to its cold state, it decreased in diameter 1.17% lineally, or 3.51% in volume. He also made a series of experiments with balls of Cleveland foundry pig immersed in fluid iron of the same quality, and found that on the average the iron, in passing from the solid to the plastic condition, expands from a specific gravity of 6.95, when cold, to 6.50, when plastic, while the fluid iron has a density of 6.88. He holds that the separation of graphite cannot be the cause of the expansion of the iron when cooling down from the liquid to the plastic state, because white iron, which has no or little graphitic carbon, does not act differently, but expands considerably. The paper brought about quite a long and animated discussion, which, however, did not contribute much towards a final settlement of the questions at issue.

In connection with the above it may be interesting to call attention to the physical changes which take place in iron and steel, when, as a wire, it is immersed in acidulated water. At the late meeting of the American Society of Telegraphic Engineers, Prof. Hughes read an interesting paper on the above subject, in which he said that the mere dipping of a piece of iron wire in sulphuric acid rendered it very brittle, and gave it many of the characteristics of steel. In the discussion which followed, Mr. Chandler Roberts announced the fact that he had succeeded in extracting from such acid-treated iron 20 times its volume of hydrogen, and he maintained that there was some relation as of cause and effect between the occlusion of this gas, and the brittleness exhibited by the metal. The reader will notice the general similarity between these observations and the remarkable results obtained by Mr. Edison when experimenting with platinum spirals for his electric lamps, which have been fully noticed in this department.

Use and Care of Files.

In selecting files, those which are warped are fit only for the commonest uses, and should be rejected for accurate work. The practiced eye readily detects the sprung file, even when, as in the bastard file, the faces and edges are convex. The file handle is important. It is not a chisel handle, nor a misshapen chunk of wood, nor a section of broom handle. The file handle is a simple handle, but it is a file handle, *sui generis*, and nothing else. It should be of soft wood—not pine—cucumber wood, bass wood or "popple" (poplar), without varnish or oil, or any finish but the turning chisel. Insert the tang of the file until it passes readily two-thirds of its length; then, holding the handle and file point downward in the left hand, give a few smart raps on the end of the handle with the hammer and the file will jump to place.

It is well to chalk one face of a file, keeping it intact until the other face is worn. A new file should never be used on the skin or scale of cast iron. After the scale is removed the new file may be used, and when it does not take well on cast iron it will cut wrought iron. Fibrous chips of wrought iron that cannot be removed by the card should be dislodged by a bit of wire—No. 8 iron wire—formed into a ring at one end for a handle, and at the other end flattened or broomed out while cold under the hammer on an anvil. To use this implement, rest the point of the file on the bench at a convenient angle, and strike the flattened wire edge across the file face in the direction of the teeth cut. If the file used in finishing with oil becomes clogged, warm it over the forge fire, the gas or lamp, and it will yield to the persuasions of the card, or if not, pour a little oil on the file and blaze the dirt off. It will not draw the temper.—*Boston Journal of Commerce.*

Perfection of Modern Machinery.—The degree of perfection that machinery has reached is shown by the work of the New Indiana State house. But seven men are building this immense structure, and their progress daily is from 17 to 20 times greater than that of the large force of workmen employed when the court house was built. The cause of this great saving is the little "travelers" now in use at the State house. These are small engines that run upon the scaffold tracks in all directions, and work which required 15 men with the old derricks. They also save much time, for one that was formerly laid in from two to three hours, is now placed in position in 15 minutes, with scarcely any trouble or extra exertion on the part of the workmen.

The Lead Bath for Tempering.

Among the many secrets of tempering is the employment of the lead bath, which is simply a quantity of molten lead, contained in a suitable receptacle and kept hot over a fire. The uses of this bath are many. For instance, if it be desired to heat an article that is thick in one portion and thin in another, every mechanic knows how difficult it is to heat the thick portion without overheating the thin part. If the lead bath be made and kept at a red heat, no matter how thick the article may be, provided sufficient time be given, both the thick and thin parts will be evenly and equally heated, and at the same time get no hotter than the bath in which they are immersed.

For heating thin cutting blades, springs, surgical instruments, softening the tangs of tools, etc., this bath is unequaled.

If a portion of an article be required to be left soft, as the end of a spring that is to be bent or riveted, the entire spring may be tempered, and the end to be soft may be safely drawn in the lead bath to the lowest point that steel can be annealed without disturbing in the least the temper of the spring not plunged in the bath. Springs, or articles made of spring brass, may be treated in the same manner. A great advantage in the use of the lead bath is that there is no risk of breakage by the shrinkage of the metal at the water line, as is often the case when tempered by the method of heating and chilling in cold water.

As lead slowly oxidizes at a red heat, two methods may be used to prevent it. One is to cover the surface of the lead with a layer of fine charcoal or even common wood ashes. Another, and a better plan, is to float on the top of the lead a thin iron plate, fitting the vessel in which the lead is contained, but having a hole in the center or in one side, as most convenient, and large enough to readily admit of receiving the articles to be tempered or softened. *Blacksmith and Wheelwright.*

Wear of Rails on an Incline.—On a down grade of 1 in 38 on the Aachen railroad, in Germany, the amount of rail wear per 1,000,000 kilometric tons (of 2,205 lbs.), gross weight, was 3.059 inches, so that a rail was completely worn out in 5 years. On Aug. 10, 1878, as an experiment, cast-steel brake-blocks were substituted for the wrought-iron ones on the left side. On taking measurements May 6, 1879, it was found that the left rail was worn down 0.287 inches, the right rail 0.35 inches, while formerly the rail on the right side was least worn. For the sake of obtaining a certain result, the brake-blocks were exchanged right with left, on the 6th of June, and the hight of the rail (20 lengths on each side of the track) carefully measured. According to the measurements made on Sept. 18th and Nov. 24, 1879, the wear on the steel brake-locks side amounted to 0.05 inches, on the side where the wrought-iron blocks were used, 0.086 inches per 1,000,000 tons gross load. On a down grade of 1 in 75, between Heissen and Mulheim, the rail wear, with a gross load of 34,000,000 tons, amounted to 0.507 inches in 8 years. The chief engineer of the road can only attribute the enormous amount of wear to the fact that the soft wrought-iron blocks bold the wheels perfectly tight, while the hard steel has not such a grip on them, they occasionally slip round, and less friction results to the track.

Cast Iron on Cast Iron.—A practical mechanic, who is an ingenious inventor, a thinking man, and whose experience as a mechanic embraces a period of not less than two score years, insists that cast iron on cast iron makes the best box and journal in use. He repudiates Babbitt metal and steel, iron and composition, and all attempts to reduce friction and perfect bearing surfaces in motion by the use of different metals. He carries his theory into practice as a builder of machinery, and clinches his argument by a 15-years' use of a swiftly rotating, loose pulley of cast iron on a cast-iron stud, and by many other examples of the advantages of the practice. The opinion of such a man, one not given to visionary notions or pet hobbies at the expense of fact, is of value—at least it is worth consideration. The theory may be that the plumbago known to exist as a component part of cast iron, fills the porea of the two rubbing surfaces and forms a glaze to resist grinding. But whatever the theory or cause, this mechanic claims that he has demonstrated that cast iron on cast iron make better journals and boxes than any two differing metals.—*Ex.*

The Substitution of Steel for Iron.—The substitution of steel for iron has made another step in advance, and in a direction where, if the hopes of the inventors are justified by the result, we may expect to see considerable changes. Hitherto the metal work of our ordinary driving carriages has been wholly iron, except in those instances where the partial introduction of steel took the place of any additional ornament. A well-known coach-building firm at the East has now on view the specimen of a carriage built wholly of steel—spring, tire, framework, etc.; and it is calculated that the saving in weight will be nearly 25%, with possibly better results in future; whilst for supporting wear and tear the preference for steel over iron will, when its advantages are known, be as strongly endorsed by owners of carriages as they now are by directors and managers of railroads.

SCIENTIFIC PROGRESS.

What We May Come To.

Proctor, writing in his latest volume—"The Flowers of the Sky"—remarks: It is no longer a mere fancy that each star is a sun—science has made this an assured fact, which no astronomer thinks of doubting. We know that in certain general respects each star resembles our sun.

Each is glowing like our sun with an intense heat. We know that in each star processes resembling in violence those taking place in our own sun must be continually in progress, and that such processes must be accompanied by a noise and tumult, compared with which all the forms of uproar known upon our earth are as absolute silence. The crash of the thunderbolt, the bellowing of the volcano, the awful groaning of the earthquake, the roar of the hurricane, the reverberating peals of loudest thunder, any of these, or all combined, are as nothing compared with the tumult raging over every square mile, every square yard of the surface of each one among the stars.

He proceeds to describe, with considerable circumstantiality, the two appearances witnessed in the heavens within the last few years—that in 1866 when a tenth magnitude star in the constellation of the Northern Crown suddenly shone as a second magnitude, afterward rapidly diminishing in luster; and that in 1876 when a new star became visible in the constellation Cygnus, subsequently fading again so as to be only perceptible by means of a telescope.

After noting the conclusions deduced from the application of the most improved instruments to these observations, he remarks:

A change in our own sun, such as affected the star of Cygnus, or that other star in the Northern Crown, would unquestionably destroy every living creature on the face of this earth; nor could any even escape which may exist on the other planets of the solar system. The star in the Northern Crown shone out with more than 800 times its former luster; the star in Cygnus with from 500 to many thousand times its former luster, even if we take the highest possible estimate of its brightness before the catastrophe, or consider that it may have been very much brighter. Now if our sun were to increase tenfold in brightness, all the higher forms of animal life, and nearly all forms of vegetable life, would inevitably be destroyed on this earth.

Street Lamps Extinguished by Atmospheric Disturbance.—The New York *Gas Light Journal* gives some interesting particulars in regard to a singular atmospheric disturbance, which was noticed in and near the city of New York on the night of the 16th of April last. A large number of street lamps were extinguished, without any apparent cause, until observations showed that a very important atmospheric disturbance was registered by the self-recording pressure gauge instruments. It appears that the pressure gauge registers showed a very decided rise and fall of pressure at about 11:45 P. M. In some cases the pressure fell first and then suddenly rose, while in others it rose first and then fell—the extreme variation was 16 tenths. At the same time the self-registering barometer at the Meteorological Observatory showed a corresponding disturbance in the atmospheric pressure. In a number of cases street lights were extinguished in certain localities; but the disturbance seemed to be confined to a belt extending from the Orange mountains, through Newark and Jersey City, across New York Island to Long Island. It is important to record this fact, for the reason that it accounts for the extinction of street lamps, in this case at least, when, if it were not for the well-established fact of the atmospheric disturbance, it would have been very difficult to do so.

Garnet as a Substitute for Emery.—In the township of Bethel, Delaware county, Penn., there occur considerable quantities of a garnet rock—a rather unusual occurrence. This rock is now mined by a firm of this city (Herman Behr & Co.), and prepared in various marketable forms as a substitute for emery. As the garnet approaches topaz, which ranks next to corundum in the scale of hardness, it is not unlikely that a massive variety of this mineral should be as hard or even harder than some grades of emery. We are informed that the firm engaged in this enterprise grinds the rock and prepares the powder of various grades of fineness, attaches it to paper and cloth, and produces cutting wheels of it, by some procedure similar to that employed in making emery-wheels. We may give a more detailed account of this industry in the future.

The Human Retina.—In a recent note to the Vienna Academy, Herr Salzer offers an estimate (based on numeration) of the probable number of optic nerve fibers and of retinal cones in a human eye. The number of the former he supposes to be about 438,000, that of the latter 3,360,000. This gives seven or eight cones for each nerve fiber, supposing all fibers of the optic nerves to be connected with cones, and equally distributed among them.

The Microscope in Botany.

The microscope is constantly enlarging its field of usefulness, and is adding, day by day, new triumphs in the direction of original research. It has recently given to the world a new and more certain mode for determining the geological structure of rocks; and the fact is now announced of a discovery of equal importance in connection with the life and growth of plants. As, in the first case, many of the universally accepted theories of geologists were brushed aside, so, in the present instance, theories which botanists had supposed to be well established are completely overthrown. It appears that Prof. Prinzheim, of Berlin, has recently been studying the green coloring matter in the leaves of plants, known as chlorophyl, and the cells in which it is contained. Botanists have heretofore assigned to this substance the work of absorbing from the atmosphere, during the night, carbonic acid gas, retaining the carbon for the sustenance and growth of the plant, and returning the free oxygen to the air to make good the deterioration of that element through the respiration of the animal creation. Now Prof. Prinzheim has demonstrated, by the aid of the microscope, that chlorophyl does not perform that work, but that the carbon in the atmosphere is appropriated and assimilated through the medium of a balsam-like substance in the plant, heretofore unknown, to which he gives the name hypochlorins. This newly discovered substance, when under the influence of sunlight, has a strong affinity for carbonic acid; and it further appears that the heretofore supposed active chlorophyl is merely a passive agent—a sort of curtain, screening the hypochlorine from the direct or too powerful influence of the sun's rays, so that it may do its work with regularity and moderation. The Prof. has shown, by experiments, that if the intensity of the sun's rays is materially increased by any optical apparatus, the chlorophyl screen or regulator, is found too feeble to protect the hypochlorine in its proper work, and oxidation sets in so rapidly that both chlorophyl and hypochlorine are rendered inert, and the plant dies. This discovery opens an entirely new field for botanical research, and furnishes additional evidence that plants have a regulator of vital forces, corresponding more nearly than the simple chlorophyl to the heart and lungs of animals, and further proof is gained in the direction of a unity of life between the animal and vegetable kingdoms.

The Energy of Cyclonean Forces.—In discussing the two cyclones which visited the Bay of Bengal in October, 1876, Mr. Elliott, meteorological reporter to the government of Bengal, incidentally gives some idea of the cyclonean forces which are developed by such storms. The average "daily evaporation" registered by the Bengal instruments in October is "two inches." The amount of heat absorbed by the conversion of this amount of water daily over so large an area as the Bay of Bengal is enormous. "Roughly estimated," says Mr. Elliott, "it is equal to the continuous working power of 300,000 steam engines of 1,000 horse power." A simple calculation will show that it suffices to raise aloft over 45,000 cubic ft. of water every 24 hours from every square mile of the bosom of the bay, and transport it to the clouds which overhang it. When we extend the calculation from a single square mile to the area of the whole Indian gulf, the mind is lost in the effort to conceive the force which, in a day's time, can lift 50,000,000 tons. Yet it would be easy to show that such figures, fabulous as they seem, do not adequately represent the cyclonic forces of a single storm.

The Circulation of Human Blood made Visible.—Dr. C. Huter, a German microscopist, has constructed a simple device by which the circulation of the blood is made visible in a human subject. His method is as follows: The head of the subject is placed in a frame, with which is also connected a microscope. The head and instrument are so placed that the lower lip may be slightly drawn out, and its inner portion fixed uppermost upon the stage of the microscope. A strong light is then thrown upon the surface of the lip, the light being intensified by use of a condenser. Thus arranged, the instrument is properly focused upon a small superficial blood-vessel, when the observer may plainly see the endless procession of blood corpuscles passing through the minute capillaries, the colorless ones being distinctly identified as little white specs, more or less thickly dotting the main body of the red stream of blood. This device may often prove of considerable importance to the medical practitioner, by enabling him to carefully note the variations in the blood flow, and the relative proportions of the white corpuscles in that fluid. This is the first instance where the flow of the vital fluid of one human being has been made visible to another. Observations as to the character of the blood have heretofore been made upon that fluid after it has been drawn from the subject, and, of course, under circumstances very unfavorable for accurate determinations.

Three blow-flies with their descendants will devour the body of a dead horse as quickly as will a lion.—*Linnæus.*

The Mining Share Market.

The comatose condition of the mining share market continues and the transactions at the board have more the appearance of playing at selling shares than of actually selling them. Comstocks and Bodies, and the entire list, have been alike dull and unprofitable, and the business of the week has been unrelieved by a single spurt. If there was any action at all the tendenoy was downward. This depressed state of things is leading share-holders to consider the expense account of the Comstock mines, and various suggestions are made to reduce the cost of working. There is a report that the Minere' Union of Virginia City is in favor of putting men to work on levels above the Sutro tunnel to extract the low grade ore at the rate of $3 per day. This proposition is referred to in our "Letter from Virginia," published elsewhere, and seems at last to have received the approval of the miners. The important thing to be done now ie to ascertain the extent and locality of the alleged reserves of low-grade ore, and thus furnish trustworthy data on which to hase the proposed economy and possible profit.

As a contrast to the sluggish and unpromising share market, mining operations along the length and breadth of the field are active, systematic and generally prosperous; and whether ehares sell or not, the mines are likely to produce largely of gold, silver, copper and lead.

Bullion Shipments.*

Since our last issue, we have noticed the following bullion shipments:

Bodie, June 14, $8,013; Northern Belle, June 14, $6,201.48; June 16, $5,871.18; Bodie, June 21, $8,010; Standard, June 21, $40,327; Tombstone, for week ending June 19, $47,369; Salt Lake City per McCornick & Co., June 15, Brooks, 1 bar, Old Telegraph, 3 bars, Stormont, 4 hars; value $16,150; at per Union Express Co., June 21, Barbee & Walker, $1,795; at per Wells, Fargo & Co., June 21, Ontario, $4,485; Plumas M. & W. Co., per Sec'y, P. Cadwallader, for May, $9,447.67; from Tuscarora, Nev., first five months of 1880, $194,389.23; from Cornucopia, Nev., Leopard, per Wells, Fargo & Co., $9,524; total receipts at Salt Lake City, eince June 11, Wells, Fargo & Co., $20,107.95; McCornick & Co., $41,250; Union Pacific Expreee Co., $14,011.02; total, $75,368.97.

*Desiring to make our list of Bullion Shipmeuts as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

LATEST FROM THE SKAGIT REGION.—A dispatch from Seattle, W. T., June 18th, eays 28 miners arrived on the steamship *Josephine* this morning from Skagit with supplies. The *Josephine* is now making weekly trips from this city to a town called Alma, located three miles above Portage City, and higher up the river than it was herctofore supposed that any steamer conld ascend with eafety. During the past week the water on Ruby creek has fallen four feet; there is still, however, too much water for euccessful sluicing. The Seattle Co. have a full set of sluices completed and are constructing a wing dam. They expect to be taking out gold about the middle of July. The Durly Co. are averaging about three dollars per day to the man, with rockers, on a bench claim. Several other claims are paying about in the same proportion. All are intending to put in eluices as soon as the water recedes sufficiently. The trail from Alma to the diggings will be completed in about 10 days. Pack trains are now running over a greater part of the distance. Some 2,000 claims so far have been located in companies, all of which are to be represented by the 1st of July.

WAUGAMANN'S DRY GOLD SAVER.—We were present, a few days since, at a trial of Waugamann's dry gold saver. About half a ton of gravel had been sent down from some claims near Oroville, which are now being worked by Chinamen with rockers, the water for the same being carried to the locality in buckets. The gravel was first put through a screen, which reduced it about one-half in bulk. The balance was put throngh the dry washer at the rate of about a ton an hour, or two tons per hour, as it was before ecreening. The work appeared to be well done, as no color was found in a pan full of tailings, which we saw carefully washed, although the amount of gold taken out hy the machine showed that the gravel was quite rich, even for a rocker. We hope to be ahle to give an illustrated descriptiou of this machine next week.

EXPLOSION OF POWDER WORKS.—On the morning of June 23d, a fire occurred in the mixing-house of the Vulcan Powder Co.'s works, near San Pablo. A elight explosion followed which destroyed the small building, but did no more serious damage. At the time of the explosion the house contained about 300 pounds of powder. Fortunately two men who were working in the mixing-house escaped without injury.

THE Nevada *Transcript* learns that steps are to be taken in that county to enforce the law requiring mining incorporations to post monthly statomonts of thcir affairs.

Death of a Pioneer.

B. F. Watkins, a native of Genesee county, N. Y., died near San Jose, May 6th, aged 57. He came to California in 1847, in search of health, for even in those early days California had a reputation afar off for ealubrious climate. He was among the first to engage in agriculture and fruit growing in Santa Clara valley. He began farming near Santa Clara in 1851, and in 1853 and 1854 planted out an orchard and vineyard, a business which he followed with more or less success until 1877, when failing health induced him to give it up. With a nature kind and gentle as a woman's, and charity as wide as the universe, he was God's noblest work—"an honest man." Although modest and retiring to an unusual degree, he leavee behind him in the hearts of his friends a place vacant that no other can fill, a picture on memory's wall that will never he taken down.

Thus do the pioneers one by one start on their onward journey, and soon there will not one be left to tell of the triale and triumphs of those early days, when our valley was one vast mustard field, with not a fence from San Francisco to Monterey, and no fruit or vegetables except at the few Missions.—*Communicated.*

HEAVY MACHINERY FOR ARIZONA.—Messrs. Rankin, Brayton & Co., of the Pacific Iron Works, in San Francisco, are constructing the machinery for the new mill of the Boston & Arizona Company, to be erected on the San Pedro river some 15 miles from the town of Benson. This is to be a 20-etamp eilver mill with all the latest improvements, and will undoubtedly be the most complete and effective reduction works in the Territory. The machinery is to be run with one of the celebrated Wheelock engines, rating at 200-horse power. This is said to be the most economical and perfect working engine the mechanical ingenuity of the world has yet produced, having taken the grand prize at the late Paris exhibition, in competition with more than 300 engines from the best builders in all parts of tho world. This engine is particularly adapted to Arizona on account of its great economy of fuel and ite simplicity of oonstruction. Messrs. Rankin, Brayton & Co. have also nnder contract a very powerful set of hoisting works for the Sunset mine of Tombstone, consisting of double engines, double drums and gearing, with a capacity to work to a depth of 1,200 ft. There will be the heaviest and most substantial set of worke of this character ever erected in the Territory. The very important developments lately made in the mine seem to the owners to justify the expense of such works and are evidence of the confidence felt in the permanency of our mines.—*Arizona Daily Citizen.*

THE YELLOW JACKET DISASTER.—On Friday, June 18th, a terrible disaster occurred at the Yellow Jacket mine at Gold Hill, Nev., by which six miners were almost instantly killed. It ie reported that the accident was caused by a carload of tools in the south compartment on the cage going up, and when within 40 ft. of the surface, it ie supposed that the drill caught the wall plate upon the car, and threw the truck and tools over in to the next compartment north, where the men were in the bottom waiting to be taken to the top to eat lunch. The body of the car remained on the cage, and was jammed in against the wall plate. On the same cage was a car loaded with rock, and under the cage a bailing tank filled with water. The engineer thought something was wrong, and stopped the engine in time to prevent further disaster. Before the men were brought from the bottom, the news of the accident spread, and the works were thronged with men and women anxious to know the particulars, and whether their friende were living or dead. The sight when the dead were laid out in the changing-room and the wounded in the bath-room, and men and women gathered around, eome weeping teare of anguish over the dead, and others crying for joy over the living, was most affecting. The names of the dead are: Neil Gallagher, —— Whitcomb, Alfred Temby, Timothy Wilkins, Hannibal Williame, and John Trezona. Two men were also slightly hurt.

POSTMASTERS' SALARIES.—The increase and reduction of the salaries of postmasters in Nevada and Oregon, at the offices specified, are as follows: Nevada—Austin, $2,000, an increase of $200; Carson City, $2,600, an increase of $200; Elko, $1,600; Eureka, $2,500, a reduction of $200; Gold Hill, $2,500, a reduction of $200; Hamilton, $1,600, an increase of $100; Pioche, $1,600, a reduction of $200; Reno, $2,100, a reduction of $100; Tuscarora, $2,100; Virginia, $2,800; Winnemucca, $1,500, an increase of $200. Oregon—Albany, $2,000, an increase of $300; Astoria, $1,800; Baker City, $1,100; Corvallis, $1,200, an increase of $100; Eugene City, $1,300, an increase of $100; Oregon City, $1,500, an increase of $100; Portland, $3,000, an increase of $400; Salem, $2,600; the Dalles, $1,800, an increase of $300.

THE Bald Monntain company, of Foreet City, have adopted a new method of working their mine, says the Downieville *Messenger*. Instead of hiring their work done by the day, a large portion of the hands are now working by the piece. For running the main tunnel $8.50 per ft. is paid. For each carload of gravel 60 to 80 cents is the price allowed. Some of those employed objected at first, bnt most of the men went to work on theee terme. It is said that fair wages can be made at these figures.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Rich Strike.—*Ledger*, June 19: W. A. Nevills recently struck a pocket of extraordinary richness in operating his gravel claim at Red hill, near Butte City. Out of a very small space he took $2,000. Large chunks of gold were met with, one worth $63, another $42, while pieces from $10 to $20 were very numerous. But the largest nugget taken from the claim—and indeed the largest obtained in Amador county, in gravel mining, for years—was picked up by Mrs. Nevills. It weighed 7½ ounces, and is valued at $142.

Water for the Zeile Mill.—The water supply for the Zeile mill is not sufficient to run the full number of stamps. It is now proposed to run a pipe from the reservoir on Mary's hill, beyond Jackson gate, right to the mill, a stretch over 2 miles, which will have to be piped the entire distance. A survey was made of this line on Monday, and it only needs Dr. Zeile's sanction to have the enterprise started at once.

Oleta Items.—Fize & Harris' quartz claim, 1½ miles north of town, is opening up splendidly. There are 2 shafts, the northern one is down 62 ft, and the southern shaft 23 ft. The ledge in the bottom of the deepest shaft is 8 ft in width. A pile of milling ore, estimated at 170 tons, lies on the dump, and a few valuation pieces it at about $8 to $9 per ton. S. H. Clark had 15 tons of ore crushed lately, which yielded $8.50 per ton. His shaft is 40 ft deep. The American Flat claim is being cleaned up. Judge Purlintou anticipates a very satisfactory output of bullion.

Important Sale.—A gentleman named Larned, of San Francisco, and J. C. Vivian, of New York, bought the hydraulic gravel claim of Patterson, situated at Indian diggings, 6 miles from Olota. They paid thsrefor $20,000 in cash. Messrs. Larned & Vivian are now in Gleta, and the machinery to operate the claim is daily passing to its destination.

Amador Queen.—*Sentinel*, June 16: Mr. James Morgan came up on the stags, Sunday, to give his personal attention to the Amador Queen. Drifting and crosscutting are being vigorously pushed forward, and the paying properties of the mine will probably be definitely settled within the next 90 days.

Pacific Co.—Work on the Pacific company's shaft, at Plymouth, is being vigorously pushed. All the men that can be worked to advantage are employed. This is intended to be the finest shaft in the State, and as the company has unlimited capital there is no doubt of the early completion of the work.

Amador King.—The tunnel at the Amador King has been run in about 80 ft and has struck a fine ledge, which is about 10 inches at the top and widens out to 3 ft. The tunnel will be run about 40 ft further when it will reach the shaft.

Mining Notes.—On Nicholas Hornberger's claim, 1½ miles east of Amador City, the shaft has been sunk 50 ft, and is going down 50 ft more. Mr. Hornberger reports the indications to be very favorable. A good strike is reported in the Etna, formerly the McKay mine.

Angels Camp.—The claims are all in full operation, and the chances are extremely favorable that they will remain so the balance of the season. We shall be able to report the biggest clean-ups ever made in Calaveras within the next month.

Volcano Items.—*Dispatch*, June 10: Mr. T. Gillick is now developing a good mine near town which promises to be second to none in the county in the way of richness. He has a shaft now down 25 ft, at which depth the ledge is 5 ft wide, and he has taken out some 40 or 50 tons of rock which will yield about $60 per ton. Mr. P. A. Clute also has a mine in process of development, near the Downs mine, which is yielding rock of fabulous richness—the free gold being plainly visible to the naked eye all through the ore. He has a shaft down about 60 ft, the ledge being at that depth from 1½ to 2½ ft in width. Work on the big tunnel is progressing. A shaft 150 ft deep has been sunk at the upper end, and the work of running the tunnel from there towards the lower end was commenced a few days ago.

Tellurium Mine.—This mine has stopped temporarily for the purpose of putting in a larger pump, the old one not being large enough to keep the mine clear of water. During the meantime the rock taken from the mine is being crushed at the Dane mill.

Amador Mine.—This mine is said to be yielding a large amount of unusually good rock now, and it is rumored that the company will put up a new 60-stamp mill next summer.

Mahoney Mine.—Work at the Mahoney mine is going ahead with a vim. The boiler is being reset and new hoisting works are being put up. The work of erecting a new mill will be commenced next week.

Bunker Hill.—This mine is now yielding some very fine-looking rock, and the future prospects of the mine are more encouraging than they have been for a year past.

Notes.—The Yellow Jacket mill has been stopped temporarily, for the purpose of putting in some new pipe and erecting new hoisting works. The South Spring Hill mine have got their new steam pump started to pumping out water, and it is said to work well. The Downs mine is looking well, probably better than ever before. Present indications point to an era of prosperity for Volcano in the near future.

BUTTE.

A Profitable Clean-up.—*Mercury*, June 16: O. P. Powers completed the clean-up of his very productive little hydraulic mine Friday, after a 2 months' run. For a month prior to the clean-up the chief had only been worked 6 hours a day. The gold obtained was cast into a brick at the bank Saturday, the value of which amounted to $7,900. There are many more pretentious mines in the State that do not pay one-quarter as well upon the capital invested.

Jackson M. Co.—*Record*, June 19: In conversation last evening with Mr. Gillenwater, Supt. of the Jackson mining company, we learned that the work upon the company's works is progressing rapidly. The saw mill will be started on Monday, and as soon as the lumber can be gotten out, the water will be brought into the claim. The company is very confident that the mine which it is about to open will be a success. Work has been much retarded by the heavy fall of snow, which rendered the road leading into Deer creek impassable until recently. When the water is brought in the company will give employment to at least 100 men.

Spring Valley.—Supt. Waldeyer is anxious to continue his present run until July 1st before stopping to clean up. He is pushing ahead with energy in splendid gravel, and confidently expects to make a better showing than the mine has ever made. In this we believe Waldeyer is right. How ever much stockholders may desire monthly dividends, they occasion a great deal of labor in taking up and repairing the sluice boxes.

Prospecting Party.—D. A. Friel, of New York, A. P. Mann, of Folsom, and R. Pendergrast, of San Francisco, were the members of a party of prospectors passing through town Wednesday on their way to Plumas and Lassen counties.

CALAVERAS.

Bonanza Clean-up.—*Chronicle*, June 19: One day this week we saw a portion of the gold obtained at the clean-up of the Bonanza hydraulic lately. There was a "swad" of the precious, we tell you. The part of it we saw—which was a mere bagatello in comparison to the entire clean-up—weighed $2,400.

Duryea Clean-up.—We learn that the work of cleaning up at the Duryea hydraulic is completed, and the fine result was satisfactory to the proprietor. Piping has been resumed, and the process of refilling the flume with amalgam is again in vogue.

Notes.—Nearly all the hydraulic claims in this vicinity are cleaning up. The clean-up at the Eureka is set at $25,000 at least, and we shall not be a particle surprised if some of the other claims exceed those figures. At the Mammoth no preparations for cleaning up are being made, the flume not being quite full of the precious metal yet. Brown & McSorley, Querel & Co., Jillson and other tunnel miners are as busy as bees, and are all gathering golden stores, too. General operations will be more active, however, especially among the hydraulicers, when the clean-ups are completed.

Whisky Slide Mill.—The work of putting up the mill on the Whisky Slide mine, Jesus Maria district, is being done just as fast as willing and competent hands can do it. We should not be surprised if the engineer would be able to blow his whistle on the Fourth of July.

Notes from Angels.—*Echo*, June 16: Judge Lindsay, while prospecting in a lot adjoining his garden, uncovered a quartz vein about 9½ ft wide that prospects well. It is no doubt a continuation of the Crystal lead, which was at one time the richest mine in this section. The Dolan & Cogswell mine is making a good showing. Only about 5 men are required to keep 10 stamps pounding. It is doubtful whether there is another mine in the State of the same extent that requires so little outlay to work it.

EL DORADO.

Main Trunk Canal.—*Democrat*, June 10: Mr. Gilson Hicks, foreman of the Main Trunk canal, informs us that the work of repairing the damage caused by last winter's storms is progressing much more rapidly than was anticipated a few weeks ago. The canal is now open and in good condition to Alder creek. The repairs above that point will not require a great length of time. For some weeks to come Alder creek will furnish all the water the canal will carry. The trouble has been from slides, loosened by saturation with water, and coming in from above. As the canal is provided with a great many sandgates, most of the slides are sluiced out. Taken altogether, however, this property has suffered much less than the large ditches north of us. It is worthy of mention that there is, and will be through the entire season, a demand for every drop of water the canal will carry.

Nagler Mine.—This mine is the property of the California W. & M. Co., and, we believe, is the most valuable gold mine in the State. The mine has been hydrauliced to a depth of from 40 to 70 ft, and some 400 ft wide by 600 ft long, on the surface, and more than $2,000,000 has been extracted from it. The whole extent of the mine is almost one mass of quartz seams, all abounding with gold, and their limits are yet unknown. A shaft, which has been put down 150 ft on one of the seams, shows a widening of the lode, 5 tons of the ore recently shipped below yielding $200 to the ton. The company is now about to put a 30-stamp mill on the ground. It is estimated that there are some 200,000 tons of rock piled up as tailings from the mine, which will pay handsomely for crushing.

Secret Mine.—Gabriel Werntz has sold this mine for $5,000. Werntz has been working on this ledge for 14 years, under all the disadvantages imaginable. It lies between the slate and granite, with 2 ledges, 1 on either wall, which are 20 ft apart. The matter between is porphyritic and all charged with gold. The rock is very rich in sulphurets, some of it assaying as high as $7,000 per ton.

Springfield Mine.—This mine (the old Church Union) is running steadily on the stopes. Sinking will soon be recommenced. This mine is the deepest now operating in the county, being down over 700 ft.

Mining Notes.—The E. D. W. & D. O. M. Co. is running the Weber, North Excelsior, Loomis and Pebble Hill mines steadily. The old Weber tunnel has reached the shaft in Coon Hollow. When the 2 are connected, systematic prospecting will be done. Work on the Texas Hill tunnel, which has been suspended for some time, is about to be resumed. The Griffith Con. is being worked right along, to the entire satisfaction of the proprietors, which is good enough. Perre Vignaut has a ledge, near the Gross mine, on which he has crosscut 13 ft through quartz showing gold all the way. The Hulhurd Bros. have struck a rich porphyry lead in the Spanish Hill district. Mason & Killough are repairing some broken flume near the head of their Silver Creek ditch, and will soon be running their mine night and day. At the Gross mine a drift is being run to determine the extent and value of the deposit. If satisfactory, more stamps will be added at once. In the Ringold the water has been lowered over 160 ft. When the bottom is reached the shaft will be thoroughly repaired, and prospecting proceeded with. The music of the Placerville quartz company and Gregon Ravine mills is only interrupted by the regular clean-ups. The Sheppard mine, some 4 miles southwest of Greenwood, is being prospected by Frank Leavitt. Three men are engaged in sinking a shaft on this mine.

INYO.

Beveridge District.—*Independent*, June 12: We have some samples of ore from a new discovery by Joseph Kelley and John R. Hughes, in Cove canyon, Beveridge district. The pieces are not represented as choice specimens, but average samples. The ore is of a solid, mineral character, stained slightly with iron and copper. Upon breaking open a piece the whole interior is spangled with fine and coarse gold. An ounce and a half, put through the ordinary horn-spooning test, produced an almost incredible display of gold. We are assured that it came from a fine vein, well formed and traceable for a considerable distance on the surface.

Gold Product.—On the authority of Ross Moore, a veteran prospector who has lately been investigating the gold belt in the Sierra west of Big Pine, we have it that the old mine now being worked by John Kelley is turning out quite rich. The arastra is kept at work with the labor of 1 man in the mine, and is turning out some $500 per month in gold.

MARIPOSA.

Yosemite Mine.—Hornitos Cor. *Gazette*, June 19: At present the company has 68 men employed; some are grading the mill site, some are getting out ore and some are repairing the Bear Creek water ditch. The grade for the mill will be completed this week, and they propose to have the mill crushing ore by the 1st of August. It will be the finest mill in the county. The Supt. wrote to the Pres. of the company to-day that he could keep a 40-stamp mill in ore from the mine. The work is being pushed forward night and day.

Notes.—The Indian Gulch mill is being built by the same company as the No. 9. It is to be a 10-stamp mill. The Washington is going ahead as usual and without interruption.

MONO.

Spring Mining District.—Bodie *News*, June 16: This new mining district, lying about six miles east of Bodie, was organized last month. We learn several good ledges have been found that show rich silver chloride ore and free gold on the surface. The ledges are strong and from 5 to 20 ft wide.

Mammoth District.—*Herald*, June 16: The showing being made in the new workings of the Alpha mine is very encouraging. This is the first location made in the district, and a large amount of labor and money has been expended upon it. The rock from the immense croppings of the ledge has always given good assays. The new cut now being run is some distance south of the old tunnel, and an immense body of rich quartz has been encountered, from which assays of $210 have been made.

Merrimac.—This mine joins the True Blue on the south. Thomas McMahon and Jas. Doyle commenced work in the shaft yesterday morning. A shaft was sunk on this property to a depth of 40 ft last summer, showing a large and well-defined ore body.

Kenusha.—A rich gold strike was made on this mine a few weeks ago, and it now presents a fair showing of rock rich in free gold. Zach Taylor and Peter Simmes are hard at work. The ledge is daily improving in appearance.

Last Chance.—On Monday last two shifts were put to work on this mine. The water has entirely left the shaft, and sinking will be resumed. The prospects already encountered are very promising.

Big Bonanza.—Hank Rodgers, John Morales and two others resumed operations for the summer on the Big Bonanza, which lies to the southward of the Mammoth mine.

Notes.—Assessment work is being done on the Comstock and several south-enders, and we are informed that as soon as Chas. Radcliff arrives, active operations will commence on Rocky Cliff. An arastra will be built to work the rich ore and give it a thorough prospecting before the snow again flies. From North Fork, Laurel and other near surrounding mining camps news of the most encouraging character is daily heard.

NEVADA.

Murchie Mine.—*Herald*, June 19: Extensive improvements are being made at the Murchis mine. The company are about to expend $50,000 in various essential alterations. A new shaft of three compartments is now being sunk about 600 ft west of the old one. It will be furnished with a double cage track. There will be three air compressors used for hoisting purposes. A new 30-stamp mill is being built. A turbine water wheel is to be put in for the purpose of furnishing the motive power for the new shaft. This shaft is expected to be completed some time during October.

Sailor Flat Co.—This mining company at Quaker Hill stopped washing last week, owing to a failure of the free water supply. They commence drifting immediately, in order to develop the channel by that means if possible.

Mohican Mine.—I. M. Holcomb and Francis Burns have obtained a lease and bond of the Mohican quartz mine on Gold Flat, Reseigh & Co. who have within the past year taken some $4,000 or $5,000 from it, disposing of their right to these parties. The sinking of the incline will be continued to the 200 level, and it is the desire of the present holders to greatly increase the facilities for working.

Graphic Co.—The 10-stamp mill of the Graphic Co. was started Wednesday on a crushing of 400 tons on the dump and in the ore house, besides which a daily average of 10 tons of ore is being produced. In the upper level a pay chimney 175 ft in length, 70 ft in width and from 15 to 24 inches in thickness is reported to have been recently discovered. The south drift of the lower level is being pushed ahead to tap the pay chimney which is above. Work in the incline has been temporarily suspended.

PLACER.

Alabama Mine.—*Herald:* This mine is developing by a New York company. The main shaft is down about 200 ft, on a 3-ft ledge, and they are still sinking. They hoist by steam power, and all the appointments about the mine seem permanent and substantial. Regarding the paying qualities of the ore we learned that the last crushing was very satisfactory.

Chicago.—Less than half a mile from the Alabama is the Chicago quartz mine, which is being systematically developed. They are down 165 ft on a 2-ft ledge, and are still sinking. They have about 700 tons of milling ore on the dump, and are talking some of erecting a mill to crush it at some time in the near future.

Gold Leaf.—The main shaft on this ledge is down about 50 ft, and although the ledge is comparatively small, the ore thus far has been quite rich, averaging, we believe, fully $30 per ton. At present the owners are sinking a new shaft, with the view of a more thorough development of their valuable property.

Newcastle G. M. Co.—This fine gravel property was purchased by the present owners last January, and immediately on obtaining possession they set to work vigorously to fit it up for washing. To obtain sufficient pressure they conduct the water about two miles through 22-inch iron pipe. They commenced washing about the 10th of last month, and have kept a stream of 250 inches, through a 4-inch nozzle, playing against the bank nearly ever since. An experimental clean-up, after 10 days' run, it is generally understood, was very satisfactory. They have in their claim 120 acres of ground, on which the auriferous gravel deposits are extensive.

Laird Gravel Mine.—This is an old location, and a steady paying property. Various processes have been tried to secure the gold in this claim, with varied success. The last, and, we believe, the most successful, is the Cranston hydraulic, by means of which the water from the pipe, together with the washed gravel, is virtually raised out of a hole, or, in other words, made to run up hill. Hydraulic pressure tears down the bank, and the water and washed gravel running down into a sink for the purpose, is by further hydraulic pressure carried up through a pipe and the whole mass dumped into the tailings sluice. At present the mine gives employment to some 8 men, and yields, we believe, in gross, from $1,200 to $1,500 per month.

Sacramento Gravel Co.—This, from what we can gather, is a very rich claim. Operations at present are confined to washing over a pile of tailings on the ground of the company in Pennsylvania ravine, which, we learned from Mr. Jas. Klees, paid quite well. Their main reliance, however, consists in drifting. They have a tunnel from Pennsylvania ravine into the adjoining gravel hill, and have been fortunate enough to strike the channel, which is very rich. For want of drain, they have worked it but little yet, though as far as developed they often got gravel that paid from $1 to $5 to the pan, and one pan of dirt from this channel has paid as much as $20.

Southern Cross.—Dutch Flat *Forum*, June 10: On Sunday quits a blast was set off in the Southern Cross mine, just above town, which shook up the town pretty lively and loosened up a large portion of the bank so that washing may be pushed along more expeditiously. The blast contained 250 kegs of powder. Work is progressing lively in this mine.

PLUMAS.

Southern Eureka.—Greenville Cor. Plumas *National*, June 19: A large force of men are employed opening up the mine in good shape. Work is being prosecuted in tunnel No. 2, and it has cut through a ledge of quartz 12 ft thick from wall to wall, and it looks splendidly. A contract has been let for a lower tunnel, No. 3, which will tap the ledge 300 ft below the surface. Work is being pushed ahead in this new tunnel, and it will be completed as rapidly as possible. The superintendent intends this for a working tunnel, and the ore for milling will pass through it. The company propose to erect a large mill, which will stand about 150 ft from the mouth of the tunnel, and the cars will drop directly into the mill, the ore only having to be handled once. The quartz can be mined and milled at very small cost.

Bell Mine.—*National*, June 19: On Wednesday last the workmen in the lower tunnel of the Bell mine, struck some wonderfully rich quartz, and it is thought that they will open a bonanza. We were shown a specimen of it which is worth looking at, being full of free gold, and a much better character of rock than we have over seen from the mine. The strike has not been developed to an extent to tell what it is, but it certainly looks very promising, and ought to be a big one.

Prattville Notes.—Cor. *National*, June 17: The water is in on Dutch hill, and the prospects for an abundant yield of the golden harvest are better than ever before, both in the drifts and the hydraulic mine.

Gravel Claims.—Through Deputy Assessor Dean we learn that our newly acquired Alaska gravel range was, on the 6th inst., covered with snow to the depth of 16 ft. This insures the miners there the best water season they ever had, and the prospects for a big clean-up are most encouraging, and they well deserve their good chances, the two principal claims, Judge Lott's and the Morrison claim-mates, having expended about $30,000, and without any adequate returns thus far.

SIERRA.

Gold Bullion Mine.—*Mountain Messenger*, June 19: The owners of the Gold Bullion, on Kanaka creek, intend to purchase several Frue concentrators, so as to save more sulphurets than they now do with their present concentrators.

Notes.—Murphy & Co. are rigging up a derrick to work their claim on the East Fork. Judging from the expense they are going to they must have a good prospect. Work is temporarily suspended on the Savage placer tunnel, on account of some misunderstanding of the men with the contractor. The Extension company made 36 ft of tunnel last week in hard cement. Jerry Norton is tearing away the bank on Pigeou Hole at a lively rate.

TRINITY.

Taylor Flat Mine.—*Journal*, June 19: We have been informed that everything would be ready and hydraulicing commenced last Tuesday morning at the Taylor Flat mine. The company has been to an immense expense bringing on water and fitting the mine for work. We learn that the ground prospects exceedingly well and certainly hope that it may pay fully up to the expectations of the owners. The enterprise displayed and capital invested deserve large reward.

Water Ditch.—A party of 4 men own a valuable water right on New river. They brought the water on a bar at the outlet of Devil's canyon last summer. They have been ground sluicing that bar, but their bedrock being too low, they had to leave it till late in summer, when water is low enough to drain the claim. Now they are extending their water down some ½ or ¾ of a mile further to what is called Sailor's bar. They carry their water through a ditch and flume 2x4 ft, with good grade, giving them between 1,500 and 1,800 inches of water, and as Sailor bar prospects well they feel confident that they will have a good thing as soon as the water is through.

TUOLUMNE.

Bonanza Mine.—*Independent*, June 19: It is rumored that the Bonanza claim of Clark, Bray and Divoll is again taking out big money; that one of the partners one night last week was seen packing a sack on his shoulder containing 75 lbs of bullion; and that on Wednesday they took out $15,000, at the little mill of Seeber's where they are now crushing some rock. Since the big strike last year of $275,000, the mine has been closed, until a few weeks ago, when they commenced taking out a save and the water. This was accomplished very recently; one of the party remarking a few days ago that they had more left in sight than had already been taken out.

NEVADA.

WASHOE DISTRICT.

Bullion.—Gold Hill *News*, June 23: The drift from the incline toward the Bullion Combination shaft and on the 2450 level is making about 40 ft per week through a very fine and promising formation of quartz giving average assays of from $10 to $12. The drift to meet it and running from the 2200 station of the Bullion Combination shaft is making 35 ft per week through a similar formation of about equal value with that mentioned above.

Ophir.—Still running north on the 2500 level and from the main east drift on that level. The material is a heavy and promising vein formation. The joint Mexican crosscut east on this level is also running ahead and looking well.

Union Shaft.—The work of placing the foundation for the 2500 pump is not completed nor is the station cut out yet. The latter work will in a day or two be sufficiently advanced to admit of the starting of the drift which is to connect this station with that on the 2500 level of the Sierra Nevada incline.

Sierra Nevada.—The west drift on the 2300 level toward the perpendicular of the main shaft has been extended 200 ft from the main north lateral drift and has not yet reached the west wall of the vein from which a raiss is to be made to the shaft at the 1700 level.

Con. Virginia.—The south drift on the 2300 level, to connect with the winze when continued on down, is making usual progress. The stopes continue their usual yield of milling ore.

Caledonia.—The work of extending the drift north on the 2300 level, to connect with the drift run south from the Ophir line, has been resumed.

Yellow Jacket.—The sump has been carried down 25 ft below the 3000 level, and a drift to the east to increase its capacity is now running. The drift on the 2828 level toward the Crown Point workings on its 3000 level has attained a length of 250 ft.

Utah.—Still sinking the incline below the 1950 level, and through hard rock, and at the rate of 15 ft per week. The southwest drift, 1750 level, has attained a total length of 527 ft, and is without change of material. The west crosscut on this level is in fine vein material and is making good progress.

I X L DISTRICT.

Prospects.—Eureka *Sentinel*, June 19: Mr. John Cavert, one of the pioneer prospectors of I X L district, is in town, having arrived 2 days ago. He brought with him some fine samples of ore. The new camp, he says, needs money, not men. There is no chance for men who go there seeking employment for wages only. Prospectors who have means to support themselves may secure desirable properties and will be welcomed, but there is no employment for other classes. The camp needs furnaces and capitalists to purchase and develop promising prospects. The population of I X L numbers about 25 men.

OREGON.

Jackson County.—*Oregon Sentinel*, June 16: Silas Draper, of Foot's Creek, gives a very flattering prospect of the clean-up in that district. He says a much larger amount of gold dust will be taken out than usual and that the miners, generally, are very well satisfied with their winter's work.

Willow Springs.—*Democratic Times*, June 18: Egan & Co. are down about 50 ft on their ledge in Willow Springs district, and the quartz is improving. John Egan showed us some ore taken out at that depth that was full of gold.

Baker County.—*Bedrock Democrat*, June 16: Mr. William Ooos has bought John Schmidt's ¼ interest in the St. John mine, the late discovery, situated 3 miles north of the Virtue mine. This mine is very rich, and the proprietors are losing no time in developing it; they are going right down on the ledge and are at the present time 20 ft deep with the shaft. The ore is as rich now as when first struck, and gold can be plainly seen in almost every piece of ore taken from the ledge. Mr. Ooos is now one of the chief owners in this ledge.

Note.—Hayes & Co., owners of a quartz ledge at Pocahontas, 10 miles west of Baker City, in 2 months pounded out $20,000 in a hand mortar.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

Lick Paper Co.—Object: To manufacture, import, buy and sell paper, and to carry on the business in all its branches. Capital, $100,000. Directors—A. D. Remington, P. H. McCormick, F. N. Delaney, C. P. Westcott and E. C. Locke.

French Zouaves' Mutual Relief Society.—Object: To assist members in distress. Trustees—Henry Bacquill, Francois Trebois, J. Jullien, J. Desberatts, Jean Pierre Daunet, Leon Borel, Joseph Pellison, Felix Candau and Barthelemy Mendiondou.

Golden Age Mill Co.—Object: To mill and sell grain. Capital, $60,000. Directors—A. Weske, P. A. Campbell, James Dunn, John R. Dunn and George Edmunds.

San Francisco G. & S. M. Co.—Location: Esmeralda county, Nev. Directors—L. T. Lazare, J. S. Fornald, W. C. Bousfield, E. J. Friedlander and S. I. Frank.

Weissbein Bros. & Co.'s Broking & Business Co.—Location: Grass Valley, Cal. Capital, $20,000. Directors—Jacob Heyman, Joseph Weissbein, Wm. Goldberg, Jacob Weisshein and Martz Hendelsohn.

Santa Clara Petroleum Co.—Place of business: Santa Clara. Capital, $1,000,000. Directors—Martin Corcoran, C. W. Upton, J. R. Crandall, F. P. Hennessy and Alonzo Dillshaugh.

The Green Monster Copper, Gold and Silver mining company, and the Hackmen's Protective and Benevolent Association, were granted articles of dissolution June 9th.

The Ocean Depths.

Dr. Carpenter, the Englisb physicist, has recently published in the *Nineteenth Century* some remarkable resnlts of bis elaborate studies of the latest deep sea explorations. The work of tbe scientific circumnavigation expedition in tbe *Challenger*, though completed in 1876, has not until within a few months, if even now, been fully reduced, and some of its most important discoveries are now announced by Dr. Carnenter, its originator. One of the first questions its labors contribute to solve is the depth and configuration of the ocean basins. The prevailing notion of the sea beds, Dr. Carpenter shows, needs considerable modificetion, none of them baving been carefully outlined, except that of tbe north Atlantic when sounded with a view to laying the first Atlantic cable. "The form of the depressed area which lodges the water of the deep ocean," he says, "is rather to be likened to that of a flat waiter or tea-tray, surrounded by an elevated and steeply sloping rim, than to that of the 'hasin' with which it is commonly compared;" and he adds, "the great continental pletforms usually rise very abruptly from tbe margins of tbe real oceanic depressed areas." The average depth of the ocean floors is now ascertained to be about 13,000 ft. As tbe average hight of the entire land mass of the globe above sea level is about 1,000 ft., and the sea area about two and three-quarter times that of the land, it follows that the total volume of ocean water is 36 times that of the land above the sea level.

These deductions, seemingly nnimportant except to tbe votary of science, are destined perhaps to serve the highest practical pnrposes of future deep-sea telegraphy. The intelligence now quarried out of tbe enormous collection of later ocean researches shows the modern engineer and capitalist the feasibility of depositing a telegraphic cable over almost any part of the ocean floor, and ought to give new confidence in the euccess of all sucb enterprises properly devised and equipped. When it is remembered that at the beginning of this century La Place, the great mathematician, calculated or assumed the average depth of tbe ocean at four miles (or 8,000 ft. more than Dr. Carpenter determines it to be from actual surveys), and that La Place's conclusion was the received view among scientists until 1850, or later, we get eome idea of tbe advance made in this branch of terrestrial pbysics by modern research.

Not less interesting is a deduction Dr. Carpenter makes from tbe deep sea temperature observations in the nortb Atlantic. In consequence of tbe evaporation produced by the long exposure of the equatorial Atlantic current, its water contains such an excess of salt, as, in epite of its high temperature, to be specifically beavier than tbe colder overflows whicb reach tbe equator from tbe opposite Arctic and Antarctic basins; and consequently it subetitutes itself by gravitation for the colder water to a deptb of several bundred fatboms. "Tbus it conveys the solar heat downward in such a manner as to make the nortb Atlantic between tbe parallels of 20° and 40° a great reservoir of warmtb." The climatic effect of tbis vertical transfer of equatorial heat is obvious. If the great heat-bearing currents wbicb enter the nortb Atlantic traversed its bosom as surface currents they would expend their warmtb largely in the high latitudes. But, as their beavy and highly beated volumes in large measure descend to tbe deeper strata south of the 40tb parallel, their stores of tropical temperature are permanently arrested off our eastern coast and ultimately made eubservient to our climate.

Mining at the Far North.—An expedition of 20 miners, escorted by a sailing launcb from tbe United States sbip *Jamestown*, left Sitka for the Cbilkute river on May 20th, witb six months' supplies. The intention of the party is to prospect for placer diggings on the Yukon river and tributaries. Tbey arrived at Chilcat on May 26th, and had a consultation witb tbe Indians tbere, wbom tbey found disposed to be friendly, which was, perbaps, owing to tbe fact that the expedition was escorted by tbree officers and 16 men from the *Jamestown*, under command of Lieut. E. P. McClellan, with instructions to enforce permissiou for them to enter tbeir country, which had beretofore been alwaye refused. The expedition was eminently successful, tbe head cbief Kluckutz, expressing friendly feelings, and promising future aid. The launch returned to Sitka on tbe 5tb inst.

Great Advantages of Mining.—If only a dollar in bullion is obtained for tbe dollar expended in the search, remarks the *Idaho World*, tbere are two dollars in specie where there was one before; aud if it be true, as it is said, that he wbo makes two blades of grass grow wbere only one grew before is a benefactor of his race, then how mnch more of a benefactor is he wbo doubles the quantity of gold and silver in the world. The search for hidden treasure is as legitimate and as praiseworthy as any of the industriee of life. Any legislation that discriminates against tbe business is unjust, and sbould he discountenanced. Gold is tbe life current of commerce. There is no danger that tbe stock will be too large. So long as it remains the medium of exchange between one part of the country and another, and between one nation and another, it will he well to encourage every effort to increase tbe home eupply, and thus strengthen the foundations of finance and trade.

The Mystery of Exchange.

We presume that most of our readers are aware that the qnotation of foreign exchange represents a premium considerahly in excess of the actual fact; hut we doubt whether all of them know precisely what is the difference. By the usage of bankers, the old Spanish dollar is assumed as the par of exchange, £1 sterling heing equal to 4 4-9 of these dollars. In point of fact, however, in the established moneys of Great Britain and the United States, £1 sterling contained es mucb gold as $4.87 of U. S. money; and this is tbe true par of exchange or rate which must be used in converting the money of one country into that of anotber. For instance, if anything costs £100 in Great Britain, its true value expressed in the money of the United Stetes is $487. Accordingly, it is a fact, familiar to all bankers, tbat wben exchange is quoted at 109½, there is no real premium, hut the true par has been attained; because, if we multiply $4.44 4-9, which is the nominal par, by 109½, which is then the quoted rate, we get $4.87, wbicb is the true par. We need scarcely add that it is owing to tbis circumstance that the exports of gold from the United Statee are not larger. If there really existed such a heavy premium on hills of exchange, as many persons suppose, it would be immensely profitahle to export gold to Great Britain. In point of fact, in view of the necessary expeneee of freigbt, insurance, and loss of interest, the margin does not more than cover the risk. The U. S. half-eagle, it may be added, contains 116 grains of pure gold, equivalent to $5; the British sovereign, or pound sterling, 113 grains, equivalent to $4.87 of United States money.—*The Economist.*

A Fossil Bed.—Recently says the Bodie *Free Press*, while a man was digging a ditch on the east side of the hill, near the Dudley hoisting works, preparatory to sluicing for gold, he struck qnite a deposit of fossils about four ft. from the surface. The first piece found was the perfect imitation of an ordinary frog. It was covered with soft clay on one side and the other side of the frog adhered to a solid piece of rock. About two ft. from this a flat stone was picked up, on one side of which was the plain outline of a fern. It was so perfect tbat the delicate hair lines of the leaves could be plainly seen. Tbe third discovery resembled somewhat the fern, and the original might possibly bave been a clover leaf. Digging a little further, quite a quantity of gold was wasbed out. The man says that his weekly clean-up amounted to abont $18.

Increase of Suicide in Europe.—According to certain statistics collected hy the director of an asylum for drunkards in Germany, says the *Pall Mall Gazette*, the number of suicides has of late increased in every country in Europe, save in Norway only. In Norway there have been on an average 9% fewer cases of suicide during the last 10 years than in the preceding 10 years—a fact whicb is attributed by the German writer to the etringent regulations against drunkenness in force tbere. In most German countries the number of casee of suicide has increased by from 90% to 100%. For eacb million of inhabitants there are now on an average every year in Saxony 300 cases of suicide; in Denmark, 280; in Wurtemhurg, 180; in Mecklenhurg, 167; in Baden, 156; in Prussia, 133; in Austria, 122; in Bavaria, 103; in Sweden, 81; in Belgium, 73, and in Norway, 40.

A Great Engineering Work to be Delayed.—A difficulty bas supervened in the construction of the St. Gothard tunnel, wbich threatens to seriously retard its completion. In tbe part of it wbere the formation is of porous white stone, the vaulting bas already given way two or tbree times, and it has required the greatest care and constant etaying witb timber to prevent the passage thereahouts from completely collapsing. In tbe opinion of tbe geologist of tbe tunnel, it can he overcome only by making a wide curve, eo as to get round the white etone instead of going through it. This would involve tbe entire reconstruction of that part of the tunnel, in whicb case, probahly, it will not be ready for traffic before the time fixed for the completion of tbe lines of approacb —two years hence.

Heavy Mining Suit.—Tbe Merrifield M. Co., says the Nevada City *Transcript*, June 17tb, bas begun suit in the Superior Court againet the Providence M. Co., whose property adjoins tbe former's claim on tbe sonth, Deer creek heing tbe dividing line. The suit is for $56,000 damages and to recover a certain portion of tbe ledge at their respective lines; also to procure a temporary injunction to restrain the Providence from extracting any more ore from tbe portion of tbe ledge in dispute. The Providence incline has a deptb of about 1,000 ft., and the Merrifield about 800. The plaintiff claims tbat the defendant bas for some time past been extracting large quantities of ore from its ground. The trouble bas been brewing for more than a year past, and has at times developed some very hitter phases.

The *Register-Call*, Central City, Col., June 9tb, says that tbe amount of hullion sbipped hy tbe respective banking houses of tbie city from tbe 1st of January, 1880, to tbe 2nd of June, foots up tbe snm of $525,000. The shipments were made throngb the express office of this city.

The Preservation of Railroad Ties in Germany.

Herr Funk, a prominent railroad official of Germany, has, in a paper contributed to a technical periodical, given the results of experience made witb the preservation of railroad ties in Germany, where various systems are very widely used. He has found, in the course of his investigations, that the average life of unimpregneted ties on the German and Austrian railroads has been as follows up to the present time.

	Years.
For oak ties	13 6
For fir ties	7.2
For pine ties	5.1
For beech ties	3.0

The average life of ties impregnated in a rational manner, witb creosote or chloride of zinc under a powerful pressure, reaches:

	Years.
For oak ties	19.5
For fir ties	14 to 16
For pine tics	8 to 10
For beech ties	15 to 18

The average life of 831,341 pine ties on 13 German railroads, impregnated on various systems, is calculated at 14.0 years. The plan of eimply steeping the ties cold in tbe impregnated fluid, or warming them or boiling them therein, has been abandoned hy most of the roads formerly practicing it, owing to the nnsatisfactory results, and the system of impregnating under a strong pressure is heing universally adopted. A few roads steep their ties in corrosive eublimate without pressure and are satisfied with the result. The employment of blue vitriol for impregnation is being more and more abandoned in favor of chloride of zinc, hecause the result is not so satisfactory, which may be owing to the fact that only steeping—or, at most, a weak hydrostatic pressure—is employed for impregnation, and an expensive copper tank is required for the purpose. The material itself is almost four times as expensive as chloride of zinc, while tbe results of impregnation with the latter and creosote are about equal. But as the impregnation witb creosote costs about three times as much as with chloride of zinc, a majority of the German railroads have gone over to the latter.

New Tunnel Project.—It is proposed to tunnel the St. Lawrence river at Montreal. An engineer has tbe matter in hand, so far as surveys are concerned, and a syndicate is on the eve of formation to apply for a charter witb a capital of $1,000,000 and horrowing powers up to $3,000,000. The tunnel will be sufficiently broad to accommodate a double track. The horing will, it is expected, he through the snbstance known as hlack rock, and, should the geological surveys previously made hy the government prove to be correct, tbere will be no more difficult subetance to contend with. The cost is roughly estimated at $3,000,000, and is less than a substantial bridge could he built for. The tunnel, it is claimed, is the only hope of tbe north ehore roads and the connection of the projected Toronto and Ottawa line, and gives a connection at Longueuil witb all roads leading to Portland, Boston and other Eastern points of tidewater independent of tbe Grand Trunk.

A Far-Off Silver Lode.—We learn from the Chico *Record* that B. F. Butler, living at Lovelocks, is building a hoat 30 ft. long, 6 ft. heam and 3 ft. deep, in wbicb he proposes to go to Central America, in search of a silver lode that be discovered in 1849. When this tiny craft is finished sbe will be taken to the Sacramento river, launched and fitted for the voyage. At present the blocks are done, and he is now forging the anchors. Tbis ie not the first experience of Mr. Butler in venturesome voyages, for in 1849 he went from Mineral Point, Wis., to Central America, in a 20-ton boat, and while exploring that country be discovered a silver lode of great valne. He has already made up a party of 15 prospectors, wbo are to go with bim and assist in developing it.

Precious Metal Resources of the U. S.—The New York *Shipping and Commercial List* of June 3d says that the precious metals are cropping out in many hitherto unsuspected localities in the United States. Aside from the principal mines in tbe Rocky Mountain and Sierra Nevada ranges, rich silver mines are heing worked in tbe Frenchman's Bay district of Maine, and ore in paying quantities bas lately been found in the Sicily Islands, near Ouacbita. Louisiana, and on the Red river, in the same State. The mineral wealtb of the country passes all comprehension.

Cheap Mining.—It would appear tbat mining is done cheaply under favorable conditions in distant Arizona. A Tucson correepondent of tbe San Francisco *Post*, writes June 8th: At Ogilly etation, 15 miles from Tucson, is a quartz mine. The ore is mined in the mountains, 3 miles away, for 75 cents per ton, hauled to the railroad by 12-mule teams for $1 per ton, and taken to tbe mill, 10 miles by rail, for 50 cents more. So it costs $2.25 per ton to get ore from the mine to the mill, which there produces $30 to tbe ton, tbus paying a very good profit.

The Colton *Semi-Tropic*, June 12tb, says: Robert Connell this morning exhibited to us a little bar of gold valued $443.32. Tbis gold is from the Black Mesa mine, in Black Canyon district, and was taken out by arastra process.

The placer mines of Los Angeles county have produced more gold the past winter tban during any three seasons previous.

Giants in Muskingum County, Ohio.

A correspondent of the Cincinnati *Enquirer*, in describing the mound in whicb the remarkable discovery of tbe gigantic skeletons were made, says it was about 64 ft. long and 35 ft. wide, top measurement, and gently sloped down to the hill where it wes situated. A number of stumps of trees were found on tbe slope, standing in two rows, and on the top of the mound were an oak and a hickory stump, all of whicb hore marks of great age. All tbe skeletone were found on a level with the hill, and abont eigbt ft. from the top of the mound. Now to a more particular description of these antiquated remains:

In one grave there were two skeletons—one male and one female. The female face wae looking downward, the male being immediately on top, with the face looking upward. The male skeleton measured nine ft. in length, and the female eight ft.

In another grave were also found two skeletons—male and female—with the female face looking upward and the male face looking downward. The male frame in this cese wae nine ft. four incbes in length, and the female eight ft.

In another grave was found a female skeleton, which was incased in a clay coffin, holding in her arms the frail skeleton of a child three ft. and a half long, by the side of which was an image, which, upon being expoeed to the atmosphere, crumhled rapidly.

The remaining seven were found in single graves, and lying on their eides. The emallest of the seven was nine ft. in length, and the largest ten. One single circumstance connected with this discovery was the fact that not a single tootb was found in either mouth, except in the one incased in the clay coffin.

On the south end of the mound was erected a stone altar, four ft. and a half wide and 12 ft. long, built on an earthen foundation nearly four ft. high, having in the middle two large flagstones, upon which sacrifices were undoubtedly made, for upon tbem were fonnd charred bones, cinders and ashes. This was covered by about three ft. of earth. This excavation was made under tbe direction of the Muskingum County Historical Society, and the things alluded to in this letter, or dispatch, can be verified by a number of witnessee who were present and watched the work as it progressed. It was pursued with great interest and diligence, tbere heing tbe etrongest incentive to prosecute the investigation, for sucb remarkable developments in mound-opening are very rare, and are therefore fascinating in tbe extreme. Their future lahors were also rewarded witb additional developments, which, if they do not throw additional light upon this giant race of people that once inhahited tbis country, will at least stimulate research.

What is now a profound myetery, the result of this excavation may in time become the key to unlock still further mysteries that centuries ago were commonplace affairs. I refer to a stone tbat was found resting against the bead of tbe clay coffin above described. It is an irregular-sbaped red eandstone, weighing about 18 lbs., heing strongly impregnated witb oxide of iron, and bearing upon one side two lines of hieroglyphics.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

DECISIONS OF THE U. S. COURTS.

Day vs. Combination Rubber Co.

U. S Circuit Court, Southern District of New York.—Decided May 3, 1880; Wheeler, J.:

1. Letters patent No. 61,172, to Thomas B. De Forest, dated Jan. 15, 1867, construed and sustained.

2. Decisions rendered in former cases, and introduced to prove that the patentee under whom the defendants claim title made the invention before the plaintiff's assignor, cannot act as estoppels, except in cases arising between the same parties or privies to them.

3. A patent will be construed in the light of uncontradicted testimony as to prior existing devices for the purpose of determining its scope.

4. The entire description in a patent, as well as the name given to the subject of invention, is to be looked at in order to give effect to every part and to ascertain from the whole what is meant.

A decree entered establishing tbe validity of the patent and the infringement of the defendants, and for an injunction and an account accordingly, with costs.

Babcock et al. vs. Judd et al.

U. S. Circuit Court, District of Connecticut.—Filed Feb 23, 1880; Shipman, J.:

1. Letters patent granted to F. Babcock, Sept. 29, 1868, for an improved window-sash holder, construed and sustained.

2. A claim to a combination of old elements will not be so broadly construed as to embrace a similar combination in which one of such old elements is omitted and an element performing a like office, hut which is of a substantially different construction and which was new at the date of the patent, is employed.

3. Had such elements not been novel at the date of the patent, its substitution in the combination would have been simply the substitution of one well-known equivalent for another, and the change would have been but formal.

Decree entered for an injunction and an accounting with costs.

---

* More complete reports of the proceedings may be found on file in the office of the Mining and Scientific Press Patent Agency, 202 Sansome street, S. F.

The Chicago mine, near Igo, Shasta county, has about 200 tons of ore in the dump that assaye from $275 to $355 per ton. They bave just struck a hody of richer ore than tbis, and tbeir etock bas risen in value 50 cents per share.

Where do the Precious Metals Go?

Where do the precious metals go? $234,000,000 of which are annually produced, is a question easily asked, and one that is easily answered. "*'Tis the clime of the east, the land of the sun*"—that parallelogram of the earth's surface included between the Red sea, the Himalaya mountains, the China sea and the Indian ocean, inhabited by nearly one-half of the human race, and among whom paper money is unknown—which has absorbed for centuries, and is still absorbing, more than three-fourths of the annual product of the precious metals. Rome, before the Christian era, imported carpets from Babylon, spices from Ceylon, silk (a pound of which was equal to a pound of gold) from Egypt and precious stones and aromatics from India. The balance of trade due to the East from the mistress of the world in the time of Augustus was $4,000,000 annually—a sum which must be regarded as enormous, taking into view that at that time the relative value of gold to silver was only one to nine; that the wages of labor and the prices of commodities were much lower than in our time; and that England and France were Roman provinces and inhabited by savage races who dwelt in huts and painted their bodies, as our North American Indians did seventeen centuries later, when the Puritans landed at Plymouth and the Cavaliers at Jamestown; when Germany was a land of forests, with a climate as cold as Canada in our time; and when Russia was a land of hogs and morasses, with its surface very little raised above the level of the Mediterrancan.

In our time all the countries of Europe, as well as the United States, are large consumers of coffee, tea, sugar, spices, silk, hemp, hides, dyestuffs, tin and other products of the East, which have to be paid for largely in gold and silver. The imports of the United States from countries beyond the Cape of Good Hope amount to $42,000,000 annually, while the exports amount to only $11,000,000. Great Britain and the other countries of Europe import annually from the East $160,000,000 more than they export to the same quarter. The exports of gold and silver from the United States during the last 31 years amount to $1,500,000,000, a sum greater than the amount of the precious metals in existence two centuries ago. The Arabians, Persians, Hindoos, Chinese and Japanese consume but little of the products of the Occident, while the products of the Orient are in great demand by the people of Europe and America. A French writer states that the Egyptians conceal $20,000,000 annually of the precious metals; and the Emperor of Morocco has filled 17 large chambers with gold and silver. The passion for hoarding is shared by the subjects of those princes. Silver pulpits and sacred ornaments of gold are very common in churches, temples, pagodas and tombs throughout the Eastern hemisphere.

The inscription which Dante in his imagination saw placed over the portals of the infernal regions, "*lasciate ogni speranza voi che 'ntrate,*" might very truthfully be transferred to the portals of the East. The solution of the problem of the disappearance of the precious metals from the countries where they are produced is *that the Orient is the reservoir into which continuously flows the gold and silver of the Occident*—a reservoir from which there is no ebb. It is with the precious metals as it is with our sweetmeats—we cannot have our cake and eat it too.—*The Economist.*

GOLD DISCOVERY IN NORTH RUSSIA.—Great excitement has been caused throughout the government of Archangel by the discovery of extensive new gold fields within a short distance of the town of Shenkoorsk. Measures have been taken by the imperial authorities of the far northern province for working the auriferous district this spring, and already applications have reached the powers that he at St. Petershurg from natives of Shenkoorsk for concessions and allotments, the land upon which gold has been discovered being almost exclusively an appanage of certain members of the imperial family. It is stated that the presence of gold in these regions, which are of a peculiarly sandy and sterile character, was first detected some years ago by a prisoner who had contrived to escape from Siberia, and who kept this a secret until last year, when he communicated it upon his death-hed to his brother, giving the latter an exact description of the locality in which rich treasures of gold-dust would be found.

IMPORTANCE OF CHEAP IRON.—The cost of iron and iron tools was a serious difficulty in mediæval husbandry. When iron implements were worth four cents a pound, that is to say at least 50 cents a pound in modern money values, the culture of the soil was superficial, and the fertility of the surface was rapidly exhausted. Before the middle of Elizaheth's reign the art of smelting cast iron was discovered, for a great deal of the Queen's heavy ordnance was made from this material. Nor is the price of wrought iron trehled, as that of most other commodities is. In the 15th century it was worth from $25 to $40 per ton; in the reign of Elizabeth from $50 to $70; for as the success of agriculture is a measure of the success with which other employments can be prosecuted, as well as a leisure class can he maintained, so the inventions of the mechanic materially assist the progress of the agricultural art and lessen the cost of its operation.

Useful Information.

NATURAL NICKEL-BRONZE.—The effect of the opening and working of the remarkable deposits of nickel (garnierite) in New Caledonia on the commercial value of this metal has already been to reduce the metal to about one-half the price at which it sold two or three years ago, and the doubt that has been expressed as to the extent of these deposits now appears to have been dissipated by the erection of extensive works, both in New Caledonia and near Marseilles, in France, for the crude reduction and subsequent refining of the metal, and the production from this source has been continually on the increase. These facts would appear to indicate that the original statements of the immensity of the New Caledonia deposits were not simply exaggerations. Another piece of evidence to the same end is now afforded by the formation of a French company, whose object is declared to be to effect the substitution of nickel-plated brass and copper by the use of solid *nickel-bronze*. This alloy contains nickel, together with various proportions of copper, zinc and tin, according to circumstances; but at least 20% of nickel is required to secure efficient protection against the action of the atmosphere and to give the desired tint. The *Journal of the Society of Arts*, referring to the new departure, states that all articles that are now made of brass or copper nickelized may be produced in solid white nickel-bronze. We take it for granted—though no special allusion to the fact is made—that the cost of the new alloy here referred to will interpose no obstacle to its general substitution for brass and copper.

A CURIOUS case came under the notice of the English inspectors of explosions of a quantity of honey which was imported into England in packages, bearing a label which, at first sight, conveyed the impression that they contained dynamite, and a good deal of alarm was excited, and the attention of the Lord Mayor was called to the circumstance that cases containing apparently a dangerous explosive were being conveyed about London. However, on investigation it appeared that the honey was in the comh, inside boxes, the tops and hottoms of which consisted of thin sheets of glass, and several of these were enclosed in a large outer package. It was, of conrse, necessary that the packages should be very carefully handled, and in order to secure this the importers had had recourse to the extraordinary device of placing upon each package the label: "Handle gently as dynamite. A drop of one inch will cause certain destruction to the contents." The words "handle gently," "dynamite" and "certain destruction" being printed in much more prominent type than the rest, the label presented the appearance described. As the use of a label of this sort did not constitute an offense against the explosives act, the inspectors did not further concern themselves in the matter.

RULES FOR FINDING HEATING SURFACES.—To find the heating surface of vertical tuhular boilers: Multiply the circumference of the fire box in inches by the hight above the grate in inches; multiply the combined circumference of all the tubes in inches by their length in inches, and to the sum of these two products add the area of the lower tubs or crown sheet. Divide by 144, and from the quotient suhtract the combined area of all the tubes, and the fire door. The remainder will be the number of square feet of heating surface. To find the heating surface of tubular hoilers: Multiply two-thirds of the circumference of the shell in inches hy its length in inches; multiply the combined circumference of all the tubes in inchss by their length in inches. Add to the sum of these products the area of both tuhe sheets and divide hy 144, and from the quotient suhtract twice the combined area of all the tubes. The remainder will be tho numher of square feet of heating surface.

EXTENSIVE FILTERING EXPERIMENT.—A filtering experiment on a large scale is about to he tried by a company in Holyoke, Mass., to ohtain pure watsr for washing purposes in the manufacture of paper. Quite near the mills is a piece of land lying lower than the canal, and this the company proposes to fill with water to the extent of about three acres. Pipes will conduct the water from the canal bank into a hed of gravel some eight ft. in thickness, through which it will pass, and it is expected that the filtering and the subsequent standing of the water in the reservoir will purify it sufficiently. The water will be ahout 10 ft. deep on an average, and will be pumped from a point about midway between the surface and the hottom. The experiment is a new one, and will be watched with interest.

A HOUSE MADE OF PAPER.—There is at the Sydney, Australia, exhibition a house huilt of paper. The entire furniture, including chandeliers and a stove, is of paper. So, too, are the carpets and curtains; and there is a hedroom in which there is not only a large paper hed, but also paper hlankets, sheets, quilts and female underclothing, dresses and honnets in the latest style. It is proposed to give a series of banquets in this huilding, at which the plates, dishes, knives, forks and drinking utensils shall be also of paper—everything, in fine, except the eatables.

A SHOWER OF RAILROAD SPIKES.—The great demand for railroad spikes has called into existence a remarkable machine, now in successful operation at the establishment of Dilworth, Porter & Co., Pittsburg. It is the invention of the late Mr. James Swett, and comprises a series of "continuous" rolls handling the material automatically. The material, in the form of hillets 2½ inches in diameter and 3½ ft. long, is taken in by the machine, and in 13 seconds reduced in diameter and increased in length to a rod 36 ft. long and 9-16 of an inch square. In 40 seconds more this rod has to be cut in two and passed through two spike machines, from which finished spikes shower at the rate of 40 tons every 10 working hours. By working "double time" five of these machines have turned out 1,100 kegs of railroad spikes per day, each keg containing 150 pounds, or 13 kegs to the ton. The product of ordinary rolls and machines is from 2 to 2½ tons of finished spikes per working day of 10 hours.

PHOTOGRAPHS THAT WINK.—The last new thing in photography surpasses the ingenuity of the man who invented the spirit photographs, and suggests how handy it would have been had that crafty person added this to his devices. A Frenchman takes one negative of a sitter with open eyes. Then he makes the sitter shut his eyes and remain in exactly the same position while another negative is taken. The two negatives are printed on the same paper, one on each side exactly coinciding. When this double-faced picture is held in proper position before a lamp, and the lamp is rapidly moved or caused to flicker, the curious effect is produced of long-continued winking. It is not claimed that a person looks more beautiful when he keeps winking, but it cannot he denied that it gives one a very interesting appearance.—*Philadelphia Record.*

Good Health.

Beware of Plasters and Salves.

Plasters and salves are more dangerous even than oil-silk or rubher overshoes, as they are usually applied to wounds and sores, and in many more cases produce harm than they do good, as they usually protract the cure, and often prevent it entirely. The cause is simply that plasters and salves are mostly water-proof, and therefore interfere with the natural function of the skin; if either of them is placed on a sound portion of the skin and kept there for a few days the skin becomes sore. Their application is often the cause of the difficulty in healing wounds. Scores of cases have come under our notice that our advice to dispense with the use of so-called healing salves caused a finger, which had been sore for months, and kept sore by the continual application of different kinds of salves, to heal rapidly as soon as the use of salves was discontinued.

It is the same with plasters; we have seen it over and over again, that a cut wound which had been covered with a plaster, to shut off the air, as a foolish prejudice teaches, had a most protracted and painful course, while a similar wound simply treated by bringing the edges together and covered with a piece of linen to keep it clean, healed in a few days. Thie keeping clean does not only mean to keep off dust and foreign substances, hut to clean off the dried hlood which may cover the cut. It is even often advisahle to put some hlood over the edges of the wound, after they have heen brought together with a few stitches or narrow cross-strips of plaster, which, however, must never he allowed to cover the wound. It should not he lost sight of that the skin is made for contact of air, and that this contact is necessary, not only to keep the skin in healthy condition, hut also when repairs are going on. Therefore no water-proof plaster should interfere. But hlood is soluble in water and absorbs air, and it bas great healing power; in fact, there is no healing salve so efficient as the blood which often covers a wound, and which therefore must not he interfered with hy any means. Under a dried crust of the blood repair goes on actively, as hlood contains all the elements required for such repair, and renewal of tissues wants the nourishing ingredients which are found in the blood.—*Practical American.*

LONGEVITY OF BRAIN WORKERS.—The great thinkers and hard hraiu workers are long-lived is asserted, with a considerahle array of facts, in a volume by Dr. Beard. He presents a list of some 500 of the most eminent names in history, including a number like Pascal, Mozart, Keats and others, who died young, and finds the average age of the 500 to have heen over 64 years. As this is far heyond the average age of farmers, mechanics and business men, he concludes that the wear and tear of hrain work is not so exhausting as is commonly supposed. The London *Spectator*, however, reviewing this theory, maintains that excessive mental toil must shorten life, and did evidently shorten it in the case of many of the 500 cited, hut they had originally more vigorous constitutions and a larger amount of vital force, and, hy virtue of this superior vitality which explains, in part, also, their superior hrain power, they were able to continue hard work even to old age, before breaking down under the pressure; though the same vital force would have prolonged life for many years if they had not exhausted it prematurely.

Biliousness.

Biliousness is a greater amount of bile in the blood than is natural; the result of which is, the eyes and the skin begin to wear a yellow appearance, while various other symptoms manifest themselves according to the temperament, habits and peculiarities of the individual; one has sick headache, another complains of a want of appetite, sometimes loathing the very appearance of food; a third has cold hands and feet; a fourth has chilly sensations involving the whole body, or running up and down the back; a fifth is costive, women become hysterical and laugh, cry or talk, while men are moody, peevish or morose. Bile is naturally of a bright yellow color, but as a man becomes more bilious, it grows darker and is at length as black as tar, causing a state of mind which the old Romans called atrability, "atra" meaning "black"; a scowl is on the countenance, and the person is illnatured and fretful, finding fault with everybody and everything; hence when a man is cross, he is bilious, and ought to be pitied and at the same time made to take an emetic. The illnatured are never well, they are "bilious," the system is clogged, the machinery does not work well and both mind and body are disordered.

The safest and best means of getting rid of biliousness is steady work in the open air, for 6 or 8 hours every day, working or exercising to the extent of keeping up a gentle moisture on the skin, this moisture conveys the hile away out of the system. The same result will be accomplished, hut not so well, by a good steam bath or by wrapping up in bed, drinking hot tea and thus "getting up a perspiration;" hut the atmosphere of the room should be pure, and the diet for several days should consist of coarse bread and fruits. Medicines whicb "act on the liver" will do the same thing, but they should he advised by the physician when other means have failed. The office of the liver is to withdraw the bils from the blood; it is the largest workshop of the body, and is at the right side about the lower edge of the ribs. When it does not do its work, it is said to be "torpid," asleep, and medicines are given to stimulate it, wake it up, make it act or work faster than common, so as to throw off the excess of bile. When it does not withdraw or separate the hile from the hlood, the skin grows yellow, also the whites of the eyes, and the man has the "yellow jaundice." When it separates the hile from the hlood, hut retains it within itself, constipation ensues, appetite is lost, spirits become despondent, and the person is languid, lazy, fretful and irritahle. The liver is in a sense like a sponge, and the bile may he pressed out of it, as water out of a sponge, by pressing the hall of the band over the region of the liver downwards, from hip to "pit of stomach," 2 or 3 minutes at a time, several times a day; this is a good remedy in dyspepsia, and also relieves the stomach of wind, giving immediate and grateful relief sometimes.—*Hall's Journal of Health.*

TO CURE FITS OF SNEEZING.—A correspondent of the *British Medical Journal* says: During the recent rapid changes of temperature I caught a severe cold in my head, accompanied by almost incessant sneezing. My unfortunate nose gave me no rest. The slighest impact of cold air, or passing from the outside air into a warm room, equally brougbt on a fit of sneezing. In vain I snuffed camphor and pulsatilla; the light catarrh still triumphed over me. At length I resolved to see what the maintenance of a uniform temperature would do toward diminishing the irritahility of my Schneiderian membrane, and accordingly I plugged my nostrils with cotton wool. The effect was instantaneous; I sneezed no more. Again and again I tested the efficacy of this simple remedy, always with the same result. However near I was to a sneeze, the introduction of the pledgets stopped it at once. Nor was there any inconvenience from their presence, making them sufficiently fine not to tickle, and yet leaving them sufficiently loose to easily hreathe through." This is really worth knowing, for incessant sneezing is among the greatest of smaller ills, and it seems only a rational conclusion to hope that this simple plan may furnish the most efficient remedy against one of the most distressing symptoms of hay fever.

TECHNICAL BREVITIES.—Sodium hicarhonate has lately been very successfully used as an application to hurns by spreading a layer of powdered salt over the hurnt part and surrounding it with a strip of moistened linen. When thus used, it at once relieves the pain and prevents the formation of blisters. Dr. Koller has tried for the same purposes repeated applications of glycerine, and reports that it is far superior to the bicarhonate in relieving the pain and preventing hlistering. It leaves the skin soft, while the hicarhonate has opposite tendency.

THE TREATMENT OF SPRAINS.—Mr. Dacre Fox, an English surgeon to a large railway company, who has had considerahle experience of this form of injury, says that in the more severe cases he finds that aftsr a few days of fomentation the hest treatment is regulated pressure, by means of carefully adjusted pads and large plasters of a special shape, varying according to the particular joint involved. By this plan he feels sure that it is possihle to control the effusion into the sheaths of the tendons and adjacent structures, to lessen the pain and to shorten the duration of treatment.

The Week.

Volume XL of the MINING AND SCIENTIFIC PRESS closee with this week. A careful retrospect of the work brings both satisfaction and pleasure to the publishers, for it presents a careful digest of all the important facts relating to the great industries of the Pacific coast, and a valuable collation of scientific, mechanical and sanitary progress. As a book of reference the volume will he found indispensahle. We have from year to year made considerahle and interesting improvements, and it is our wieh and intention to present to our patrons a journal as nearly perfect as possihle in every department. The measure of our euccess, no less than our ambition to gratify our readers, will impel us to etrive to attain greater excellence.

The general report respecting the damaging effect of the northers on the wheat crop is more eatisfactory, and there is now a reasonable assurance of a fair yield of an average quality of wheat throughout tbe State. The hrighter prospecte are cheering, and lighten the lahore of the harvesters who are now fairly in the field.

Our mining regions continne to eend good reports of active and prosperous operations. It is noteworthy that the demand for mining machinery is brisk, and our macbine shops are husily engaged in filling orders for mills and other apparatus for near as well as remote eections.

Since our lest issue the Supreme Court of the State has rendered two important decisions; the first declaring the McClure charter unconstitutional and inoperative; and the second, that the capital etock of corporations is taxahle. U. S. Minister Angell and Commissioners Trescott and Swift have sailed for China; news hes heen received of the death at Washington of Gen. John A. Sutter; and the Democratic Convention at Cincinnati has nominated Gen. Hancock for President.

Work of the Drainage Commission.

The Board of Drainage Commissioners, the membors of which have inspired the fullest confidence in the people, has entered fairly upon the discharge of the responsihle duties imposed upon it. As the action of the Commissioners is destined to affect botb the welfare of communitiss and ths special intsrests of individuals, any plans which they may propose or adopt will havs an absorhing importance and should receive the fullest puhlicity. With this object in view we propose to keep our readers informed of every importent scheme undertaken hy the Board.

The large debris dam to he constructed on the Yuba river has received the special attention of the Commissioners who have examined hoth sides of the rivsr, and caused plans of the proposed dam to he drawn. We present from the Yuha City *Banner* a hrief outline of the plan, which shows that the dam is to be huilt from one hluff to another hluff on the opposite side of the river, distant some 5,000 ft., or nearly a mils, and the hight to he eventually over 40 ft. The hase of the dam is to hs ahout 100 ft. wide, and will he composed at first of small stones, ths size of the stones to he gradually increased as height is attained. Heavy stones are to hs placed on the lower side of the pile for the purpose of supporting it. Ths base of the dam will he so constructed as to allow the weter to percolate through it until the interstices are gradually filled, and hy that time the dam will he so high and huilt in so suhstantial a manner, and will be fortified, too, hy the long, sloping deposit which will extend back and up the river, that the water can flow over the top without at all endangering the structure. It is not believed that the dam will he huilt to a greater hight than 10 ft. during the present season, hut that hight will present a sufficient harrier to the descent of the debris. Immediately ahove the proposed site of the dam, there is a valley having an area of ahout four square miles, and it is alleged that the checking of the water hy the dam will cause all the sediment and debris held in suspension to spread over and settle in this gorge, and that a grade will form and extend hack and up the river for six miles, the upper end of which may be higher than the dam. The process of this formation will he similar to that hy which the elevated hed of the river has already heen formed, that is to say, hy the natural force of gravitation. It is estimated that when the dam is completed the river in a time of flood, and running across the entire upper surface, will not he more than one ft. deep, and that the pressure upon tbe dam from above, though great, will not he a eource of danger, hecause the new-formed and gradually sloping deposit, extending for miles ahove, will act as its own support.

IMPORTANT MINING DECISION.—The interesting case of the Iron against the Luella mine, says the Denver *Reporter*, which occupied the U. S. District Court recently, was decided after a short deliheration by the jury, in favor of the defendant. These two well-known Leadville mines lie together, and the Iron mine claimed that having the outcrop of its deposit it had a right to follow this deposit outside of its own lines, and hence that it owned the deposit which was disclosed hy the Luella shaft, as said deposit was simply a continuance of that in the Iron mine. The verdict settles the question that a deposit at no greater incline than those at Leadville cannot he followed outside of its own lines, and will he very generally approved there and throughout the State.

A GROUP OF RICH MINES.—The *Mining Review*, Col., contains an account of the mines of Ouray county, among which there is a group of remarkahly rich gold-hearing veins. It says the Sheridan is conceded to he the richest mine in the county, and has never yielded a lower return at mill than eight and one-half ounces to the ton, while a large percentage of the ore has given as high as 16 ounces of gold and considerahle eilver per ton. The Cimarron and the Pandora also yield largely of gold and eilver. Ore produced hy the N. W. H. Jr. mine, gave a mill yield—first class, $13,000 per ton; eecond class, $8,000 per ton; and the average of the ore exceeds $100 per ton.

POPULATION OF ALAMEDA COUNTY.—During the last decade there has heen a large percentage of increase in the population of Alameda county, ae the following list of ite cities and townehips will show: Oakland, 35,000; Alameda, 5,094; Brooklyn, 3,100; Murray, 3,050; Washington, 3,002; Eden, 3,662; Temescal, 2,548; Berkeley, 2,023; total, 58,990. In 1870 the population of the county was 24,237, and of the city of Oakland, 10,500.

GRAVEL BEDS IN SHASTA COUNTY.—There were reported recently valuable discoveries of gravel deposits in different parts of Shasta county, which, if they prove to be well founded, will revive the general interest of tbe county. In addition to the gravel heds there is said to have heen eome important finde of quartz veins. Iron and gold certainly ought to constitute a solid hasis for enduring prosperity, and Shasta's opportunity appeare to be at hand.

Academy of Sciences.

The regular semi-montbly meeting of the Academy of Sciences was held on Monday evening. Mr. C. Wolcott Brooks presided, in tbe absence of Prof. Davidson.

Several donations of fish were made to ths cabinst, including some received from B. B. Redding and Prof. Jordan. Among them wers some candle-fish, used as candles by the Indians. Tbese fish are found in Nevada, living in hot springs which issus from rocks nsar Honey Leke. An explanation of their development in so strange and isolated locality was offered hy Mr. Redding, and an extract read from the Reno *Gazette* treating of ths matter.

A Valuable Fiber.

Mr. B. B. Redding presented, on behalf of pertiss residing near the Mohave desert, specimens of a plant growing wild in that locality, used hy the Indians for making a strong description of cordage, the seeds of which they prepars for food, using the result as a species of pinols. The gentleman forwarding it to ths Academy, thought it could be grown in our State as a valuahle fiber, capahle of estahlishing a new industry for our people.

Dr. Kellogg thought it resembled a speciss of the *Salvia Columbaria*. He said it had a beautiful purplish hlue hlossom, and yields a large quantity of seeds, which may he successfully used as sye-stones, for, when inserted under the eye-lid, the moisture of the eye causes them to throw out a pleasant and delicate mucilage, which flows toward the corner of the eye, taking with it any foreign suhstance which it is desired to remove. Seeds put in water increese to five times their hulk. Similar seeds are found in Aztec graves, showing that in their daye the climate of this locality produced similar plants, whose valuahle qualities were known and availed of as food.

Dr. Kellogg, on hehalf of the committee appointed to report suggestions in regard to a botanical garden, asked further time, which was granted.

Certain Ice Forms.

Mr. P. S. Buckminster read a valuahle paper in continuation of a former one, on certaiu "ice forms," in which, after recounting the results of similar observations made hy Stephen Elliott, Sir John Herschell and Prof. John Le Conte, he cited a number of pertinent details which they had not attempted to account for. Some forms observed by Mr. Buckminster in mines, he described es made up of some hundreds of needles, associated in prismatic hundles, from a quarter of an inch to three-quarters inch in diameter.

In regard to the production of these ice forms, Mr. Buckminster concludes that the crystalline forms observed by him received their eupply of moisture at the earth's surface, where it was deposited hy gravity, the attraction of cohesion prohably exercising some influence, hut not heing a necessary adjunct. The water having exuded, congelation commenced and was continued at the hase of the forms through the force of crystellization transmitted through them, there existing and continuing such relative condition between the temperature and supply, that a viscous condition was maintained at the hase of the forms, which restrained them from falling and enahled their projection or growtb.

The conditions of the occurrence of similar formations upon plant eurfacee as observed hy Sir John Herschell and Prof. Le Conte, would indicate that there accumulates in some way, within the plant formed, a projectile force which forces the water out, and that it is congealed through direct contact with the air. A sudden contraction of the skin and woody shell of the plant was euggested as a possihle occurrence and reason, hut it was only offered as a suggestion. Mr. B. thought it possihle to realize the earth forms described hy Prof. Le Conte, hy accepting that the water is supplied through the agency of the force of cohesion, and huilt up hy the forces of crystallization, the force of congelation heing in thie case one of the forces. Particularly would this he possihle, if it should hereafter he determined, as he thought it would he, that these as well as those observed hy him are true natural crystalline forms.

Mr. Redding gave a very clear and interesting account of the experience of parties engaged in collecting and shipping ice from the Sierra Nevada. He said, when they had cut ice frozen in the mountain lakes at a low temperature to a thickness of two ft. or more, and removed it to ice-houses, that, if left lying flat in the position in which it had frozen, it always developed a tendency to disintegrate, and to separate into a mass of long, vertical and parallel crystals; while if etored on its edge, it kept much better, and usually without that drainage from melting which occurred inevitahly when stored in the other position.

Magnetic Influence on Cryetallization.

Mr. Brooks suggested the theory that electrical currents, acting vertically, were perhaps the active agents of nature in the organization of crystalline forms, and a different presentation of the structure to the current might arreet or change the peculiar action involved in these conditions. Mr. Buckminster stated that he was well satisfied that certain mineral crystals were continually forming in eome mines already worked out, and if the agent in one case of cryetallization was electric, he knew of no reason why tbe law ebould not bc general, and also apply to the formation of ice-crystals as well; hut that he was rather of the opinion that in crystallization there might exist a douhle and simultaneous action. He thought it quite likely that the six sided crystals of ice might hs huilt downward, from the hottom of ics, first crusting over a pond, and their crystals follow given lines of vertical magnetic currents, and thus huild down prismatic needls-like columns, packed closely together in hnndles, and forming by association, extensive fields of ice, in which case a change of its position might vary its immediate susceptihility to megnetic influence.

ACTIVITY IN MINING MACHINERY.—Tbat there is unusual activity in mining operations throughout the Pacific slope, the orders at our principal foundries and machine shops cleerly prove. The character of the work, too, indicates the thoroughness of the plant which various mining and reducing companies ars constructing. For exemple we will mention the following orders which have hesn received hy Messrs. Rankin, Brayton & Co., of the Pacifo Iron Works, the execution of which has grsatly pressed their large estahlishment: A 20-stamp silvsr mill for the Boston and Arizona company, at Tomhstone, Arizona; a 20-stamp mill and hoisting works for the Golden Eagls company, Glohe district, Arizona; a pan mill and roasting furnace for the Silver King mine, in Piual county, Arizona; a 40 hundred furnace for the El Dorado canyon mill, Arizona; a 60 hundred furnace for the Warsac mill, Utah; a 30-ton galena smelting furnace for the San Xavier company, and a 30-ton copper furnace for the Ajobo, hoth in Arizona, and a 10-stamp silver mill for Mexico. In addition to these special orders, the Pacific Iron Works, which has long made mining machinery a conspicuoue feature, has a large list of lesser ordere for apparatus, from mining and milling companies in various parts of the coast. Douhtless other foundries and shops in the city are fully as husy. The character of the machinery ordered implies the extent and value of tbe mining operations going forward in every State and Territory of the Pacific, and impele one to predict a large yield of the precious metals in sections hitherto unproductive and almost unknown. A hrief visit to the Pacific Iron Works, or any other of our spacious machine shops, will inspire the fullest confidence in our great mining industry.

THE MCCLURE CHARTER DECLARED INVALID. As was fairly anticipated hy every reflecting citizen, the Supreme Court has declared that the McClure charter, passed hy the late Legislature, is unconstitutional and inoperative. The decision of the Court, which was written hy Justice Myrick, is voluminous, and deals with the merits of the case in the fullest manner. The Court held that the city has the right to adopt its own charter, framed hy a Board of Freeholders or any other legally constituted hody of men; or that the Legislature can hy a general law frame a charter for all cities alike in the State. The decision of the Court is hased on Art. II, Sects. 6, 7, 8, of the new Constitution. It is a timely affirmation by our highest trihunal of the wholesome principle of local self-government, which was fast becoming ohsolete. "To us," says the Court, "the general intention to emancipate municipalities as far as it could consistently he done from the control of the Legislature is apparent; and we cannot hold that general lawe for the government of euch municipalities can take effect in any of them until a majority of the electors so determine without violating not only the epirit, hut, likewise, the plain letter of the Conetitution." The decision has removed all douht and uncertainty, and gives, we imagine, general satisfaction.

A REMARKABLE MINING SUIT.—Peter Grub sold his share in an iron mine at Cornwall, Pa., reserving the right to enter upon the premisee forever, and take therefrom sufficient ore for the supply of one furnace. That was almost 100 years ago when iron ore was smelted in a somewhat crude fashion, and the average yield of a furnace wae 1,500 tone a year. That was ahout the amount taken hy Mr. Gruh annually during his lifetime. But the process has heen vastly improved eince then, and now a furnace turns out as much in a single month. The question arose, of course, whether the heirs of Gruh were entitled to as much ore ae would supply an 18th or 19th century furnace. A lawsuit has heen in the courts for 24 years, employing some of the ahlest lawyers in the State. The Supreme Court has just decided on appeal, that ore can he taken in sufficient quantity to supply a furnace of the present time.

A RICH MINE IN FRESNO.—The Fresno *Republican*, of June 19tb, contains an interesting account of the important discovery of a rich gold-hearing ledge on Sycamore creek. The property is owned hy a San Francisco company. That paper says that the vein is 12 ft. wide, and no piece of rock fails to yield gold, when pulverized in a mortar and panned out. Thirteen assays have been made, giving $68 as the average value per ton. A shaft has heen sunk to a depth of 15 ft., and will he continued downward to a depth of 50 ft. as a test. Should the ore at that depth prove as valuahle as it ehows ahove, the company will speedily erect a fine mill and develop this most promising mine.

Scenes in the Yosemite Valley.

Our engraving gives a faint impression of some of the majestic objects in the Yosemite valley. The scene is in the canyon of the Merced river, which branches out an angle from the Yosemite valley proper. In the foregronnd is seen the trail leading np the Merced canyon, and which brings the visitor ere long to a near view of the wonders which are peculiar to this branch of the Yosemite. The trail rises rapidly and follows the course of the Merced river. So sharp is the ascent that in two miles an elevation is attained 2,000 ft. higher than the entrance to the canyon. In reaching the lower level the Merced river plunges over numerous cascades and makes two grand falls, which are among the greatest attractions of the Yosemite, according to Whitney, not only on account of their hight and the large body of water in the river during most of the season, but also on account of the stupendous scenery in the midst of which they are placed.

The first of these two grand cataracts is Vernal fall, which is shown in the center of the engraving. Whitney places the hight of this fall, at the average stage of the water in June and July, at 400 ft. The rock behind the fall is a perfectly square cut mass of granite extending across the canyon. The rock near the bottom of the fall is steeply inclined, so that a precise definition of the place, when the perpendicular part ceases, is very difficult amid the blinding spray and foam. Alongside of the headlong roaring stream from Vernal fall the trail leads up to the base of the fall from which the visitor may ascend by ladders. At the summit of the fall the view down the canyon, as well as in the opposite direction, is extremely fine. The system of ladders by which this summit is reached, in the winter time is covered by masses of icicles wonderful to behold. We are now engraving a winter view of the ladders, which will appear ere long.

Aloft in the sky, above the center of the engraving, is the "cap of liberty," a most notable object. It is a mass of rock, isolated, and nearly perpendicular on all sides, rising perhaps 2,000 ft. above its base. The cap of liberty has a striking resemblance to the object its name indicates. It is so marked that it is often recognized as it is viewed from various elevated points about the valley. It is an embodiment of grandeur, and its impress is firmly fixed upon the mind of the beholder.

The visitor who ascends the canyon of the Merced above Vernal fall meets something grand and impressive every time the view changes. About a mile from Vernal fall, but hidden from view by the lofty bluff in the engraving, is Nevada fall, which is pronounced by Whitney as in every respect one of the grandest waterfalls in the world, whether we consider its vertical hight, the purity and volume of the river which forms it, or the stupendous scenery by which it is environed.

BUYING MEXICAN MINES.—We learn that there is at the present time quite a large number of American prospectors, chiefly from this coast, both as agents and principals, engaged in search for mines in the of States of Sinaloa, Sonora and Chihuahua. The *Chronicle* says it has positive information that California and Eastern capitalists have recently invested in mining property in Sonora and Chihuahua to the extent of over $1,000,000. The title deeds and descriptions of the property are now being translated by the most competent expert in the city. No particulars of the transactions will be given to the press until absolute possession of the mines are taken. A Mexican journal states that ex-Governor Pesqueira of Sonora has sold his mining property for $250,000 to a party of American capitalists, but this sale does not include the purchases previously mentioned.

THE PECAN FOR CALIFORNIA.—Dr. Strentzel, from long observation, is convinced that the pecan is the nut tree for California. For two or three years in starting it requires good care, after which it will prove a hardy tree here. Its useful qualities for timber are similar to those of the hickory, to which family it belongs. Its wood is darker than hickory. It starts easily from seed, is naturally a rapid grower, and is a handsome street, shade and ornamental tree. It fruits in from 10 to 15 years. It takes kindly to this climate and invites cultivation.

CAPITAL STOCK TAXABLE. — In the suit brought by the city to collect taxes for the fiscal year 1876–7 from the Spring Valley water company, the Supreme Court on Tuesday rendered a decision in favor of the city. The effect of this decision is to make the capital stock of all corporations taxable. This year the assessments on capital stock will include the City Gas-light company, Spring Valley water company, the banks of California and Nevada, besides many lesser corporations.

MR. JOHN MUIR, the author and geologist, is spending a quiet summer with his happy bride and her father's family at Alhambra. He is writing leisurely for Eastern magazines, and has promised to favor Pacific coast readers in the pages of the *Californian*.

An Awakening in the Lumber Interest.

We note with pleasure that the better times which seemed creeping into the lumber interest of the coast last fall, have at last so asserted themselves that measures have already been taken for increasing production. Our magnificent timber resources and the vast amount of capital already enlisted in developing them, have undergone a long period of quiet, and the result has been depression and scarcity of funds in the lumber regions. A change was imperatively needed to bring these enterprises into the line along which most of our special industries are moving. Last fall there seemed a chance to move for a better order of things, and the lumbermen were awake to avail themselves of it. Then, however, it was more or less a prospective matter and the early spring demand was the test which should finally shape the industry. This fortunately was so favorable to a resumption of activity that nearly all the saw mills in California, especially on the northern coast, are now running on full time and turning out their full complement of material.

VIEW IN THE CANYON OF THE MERCED – YOSEMITE VALLEY.

The city trade is still light, and this may easily be accounted for by the fact that the influence of a prosperous year has not yet had time to exert itself in surplus funds in the hands of merchants, and by the other fact that there is small demand for new buildings, either for use or as an investment. In the country, however, there is considerable building activity prevailing, and calls for lumber are quite satisfactory to dealers. California redwood is being taken to Nevada and Arizona, and is preferred to the pine produced by local mills. This feature gives us an outlet which helps dispose of the large production which busy mills send forward. It is not expected that there will be anything of special profit in the business, nor that high prices will prevail. It will be better for the general advancement of the country that they should not. With prices fairly remunerative to lumber producers, but not excessive, much more material will come under the carpenters' tools than would under a high price list. The result will be a marked improvement in our buildings, and activity in the lumber districts. These two satisfactory conditions are both dependent upon a reasonable rate for the product of the mill.

The improvement in this market of course influences all lumber districts tributary thereto. A late dispatch from Seattle, W. T., says: "Seven Puget Sound saw-mills, representing an average capacity of 810,000 ft. of lumber per day, have resumed full time, which would indicate that the depression which so long has prostrated the lumber trade of that section, is about to be superseded by fresh prosperity, calling for a largely increased production of logs and manufactured lumber." Thus life at this center is calling forth activity in all the outlying producing districts. We hope all our readers will succeed so well in this year's labors that they can all make an investment in lumber for the improvement of their homes and farm buildings. There is no little satisfaction driving nails, especially when the lumber is paid for.

ARKANSAS SILVER MINES.—A correspondent of the *Engineering and Mining Journal*, writing from Silver City, Ark., gives an interesting account of silver mining at that place. He says what we believe will be news, indeed, to many people on this coast—that a great silver belt extends north and south 60 miles, and probably 100 miles east and west. The principal developments are, however, in the vicinity of Silver City. The outcrops are heavy and easily traced, generally taking a course north of east. A fact worthy of note is the number of veins. Right in the heart of the city there is a number of mines, one of which is yielding very fine ore, which is shipped to Galena to be smelted. The ore consists of galena, gray copper, brittle silver and chloride, and it is estimated that it will yield $500 per ton. But the silver fields only constitute a part of the mineral wealth of Arkansas. Through the counties of Polk, Pike, Sevier and Howard, immense outcrops of galena, iron and copper are found, besides the largest deposit of antimony in the known world; and last, there is gold—gold in the sands and in the quartz veins.

TIMBER-DESTROYING FUNGUS.—We learn from a letter by J. P. Moore, in the Healdsburg *Enterprise*, that he has found the timber-destroying fungus at work in the trees thereabouts. Mr. Moore says: "It attacks the living spruce (the *Abies Douglassii)* and it is *certain* death. It may be seen now on the apruces on the ridge just beyond the bridge west of Healdsburg, and is of yellowish color. It appears outwardly upon the bark as a shell-like looking protuberance, but its roots *(mycelium)* are deep within and run along under the bark, or penetrate the wood. Trees so attacked, in the no distant future, succumb. It is the *Dædalea vorax* (Harkness) and is a most interesting fungus." This fungus was fully described, with illustrations showing its method of operation, in the RURAL PRESS, January 25, 1879. We refer our readers in that region to their files of the RURAL for further points concerning the announcement made by Mr. Moore.

A NEW process for manufacturing paper from grass has lately been patented. The grass is used while green.

Letter From the Comstock.—No. 1.

EDITORS PRESS:—There is a general belief now existing in San Francisco that the mine managers of the Comstock are combining to crush out the Miners' Union. I hardly consider this to be the fact, and think it will not be hard to show that the Union itself is responsible for the hard times now existing. John Mackay is reported as having pronounced the *ultimatum* that the miners must work for $2 a day. This is incorrect. I have frequently heard him express the opinion that $4 was little enough for a man working in the lower levels. These are his words: "Whenever I see a man sweating in a heated drift for four dollars a day and a wood-cutter on top getting five, I feel that the two should change wages, for the miner certainly earns the most."

The Low-Grade Ores.

There is a proposition which has been discussed for some months regarding the taking out of low-grade ores above the Sutro tunnel level. It is suggested that a couple of thousand men be put to work taking out this ore for $3 a day; this would give work to the unemployed, and no man now receiving $4 at a greater depth would have his pay reduced. The Miners' Union refuse to accede to this proposition, on the grounds that there is no low-grade ore above the tunnel level. This is really no objection at all, for if the mine owners will put two thousand men at work taking out waste rock, it certainly cannot matter to the men employed what kind of ore is found so long as they get their $3 a day, whereas now they get nothing. The assertion that no low-grade ore can be found there is all humbug. It lies in large quantities in Savage and Gould & Curry on the 500 level and above the old tunnel level. In the Ophir there were hundreds of tons sent to the dump from the 600 level, assaying $25 a ton, and on certain levels of the Belcher and Crown Point there is any quantity of it stored away. At the time when it cost $25 a ton on the Comstock to reduce ore, everything below a $30 assay was cast aside, the mine owners only going for the pluma of the pudding. Col. Fair has repeatedly said that he would like to put a hundred men to work at $3 a day on the low-grade ore in the Occidental. If he only cleared 25 cents per ton he would like to keep the mill running and give men employment; yet the Miners' Union pronounce the fiat that these hundred men must walk the streets idle. In fact, there is hardly a mine on the Comstock which does not hold ore in the upper levels, which could not be worked at a slight profit with wages at $3, and some of them would produce enough bullion to relieve the coast of the heavy assessments now draining stockholders. Beside, there is plenty of unexplored ground in the localities named where bonanzas may lie.

At the North End.

The developments at the north end are not being kept back for the purpose of freezing stockholders or that election purposes may be secured. The managers are as anxious as anybody to see an ore body opened up, as they have millions staked upon the gamble. They have every confidence in the ultimate result, and are pushing explorations just as fast as the work now progressing at the Union shaft will let them. At present the boom is kept waiting simply because there is no regular ore body yet found. Rich places are encountered which give indication of being detached from the main mass, and, as progress is made north, the stringers and seams grow stronger, but no regularly defined body. Skae's old incline winze is down to the 2500, and the Union winze from the 2400 to the 2500 level is 160 feet south of the Sierra Nevada incline; a north drift is running east of the vein to the Sierra Nevada winze, and has 30 ft. to run to make the connection. Seams of ore are showing up on west side of this drift. Explorations are being made still further north, but with what results it is impossible to ascertain.

HARD DRILL.

MINES OF NEW MEXICO.—Prof. Silliman lectured recently at the Bullion Club, New York city, on the "Mines of New Mexico." The Prof. had just returned from a visit to that Territory. In the course of his lecture he stated that by turning the waters of the Rio Grande into a canal in northern New Mexico enough gravel can be washed out there to pay immense sums in rich gold for ages to come. He said that a company of capitalists was about to develop that part of New Mexico, and he had no doubt they would be bountifully rewarded. He estimated the value of 2,000 acres there at $240,000,000, and said it would take 300 years to exhaust that region. He said the only trouble there has been want of water. He also spoke of other remarkable deposits in New Mexico.

A GOLD DISTRICT.—We are informed by the Inyo *Independent*, that a party left Cerro Gordo recently for the purpose of starting up for the season the steam arastras at Beveridge district, where Hunter, Hughes & Co. have several big gold mines, each opened more than 100 ft. in depth. The extraordinarily rich, small strata worked by the Mexicans of the district produce from $1,000 to $2,500 per month, gold—the exact yield of bullion, but where it all goes to, is a mystery to outsiders. The yield from Taylor's works will show a handsome aggregate during the season.

Business Directory.

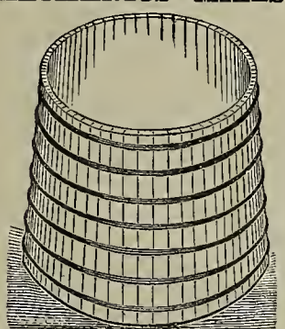
WM. BARTLING. HENRY KIMBALL

BARTLING & KIMBALL,
BOOKBINDERS,
Paper Rulers & Blank Book Manufacturers.
505 Clay Street, (southwest cornsr Sansoms),
SAN FRANCISCO.

JOHN A. CHURCH, E. M. PH. D.
MINING ENGINEER,
Room 75, 115 Broadway, New York.
☞Agent for PADDOCK'S Ore Dressing Machinery.
Mining Machinery supplied.

San Francisco Cordage Factory.
Established 1856.
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.
Extra sizes and lengths made to order on short notice.
TUBBS & CO.,
611 and 613 Front Street, San Francisco

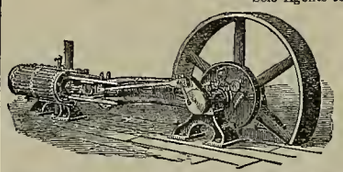
A. S. HALLIDIE,
Office, No. 6 California Street,
SAN FRANCISCO.
Manufacturer and dealer in all kinds of
Iron and Steel Wire Rope,
Flat and Round, for Mining, Shipping, Hoisting and General Purposes.
Having the most complete and extensive Wire Rope Works in the United States, I am prepared to manufacture Wire Rope and Cables of any length or size at short notice, and guarantee the quality and workmanship equal to any made at home or abroad.
Iron, Steel and Galvanized Wire
Of all sizes on hand or made to order.
Barbed Fence Wire.
Sole Proprietor of
Hallidie's Endless Ropeway,
For the Transportation of Ores, Etc.
☞Send for a Circular.
A. S. HALLIDIE.
Office, No. 6 California St., San Francisco.

MECHANICS' MILLS.


OUR WELL KNOWN
WATER TANKS,
Made by machinery, constantly on hand and made to order. PAN STAVES, WOOD PULLIES and OAK GUIDES a specialty.
WELLS, RUSSELL & CO.,
Mechanics' Mills, corner Mission and Fremont street.

NOW READY!
OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!
History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.
By ROBERT GRIMSHAW, Ph. D., M. E.,
Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.
This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of al U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.
Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid.
ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia.
March 10 1880.

Dewey & Co {202 Sansome St.} Patent Ag'ts

PACIFIC MACHINERY DEPOT.
H. P. GREGORY & CO.,
Nos. 2 and 4 California Street, San Francisco.
Importers and Dealsrs in every description of
MACHINERY!
Sole Agents for the Pacific Coast for


BUCKEYE
Engine Company.
J. A. Fay & Co.'s Wood-Working Machinery; Bement & Sons' Machinists' Tools; Blake Steam Pumps; Knowles Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould M'fg Co.'s Hand and Power Pumps; Eclipse Windmills; Disston & Sons Circular Saws; Otto Silent Gas Engine; Ducs' Elevator Cups; Ballard's Oak Tanned Belting.

Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

OXYGEN!

What is it? Everybody knows it is as essential to life as food itself. Yet when people are ill for the very want of revitalization through respiration, they dose themselves with drugs and bitters to the effect of demoralization! **All Invalids** should read Drs. STARKEY & PALEN'S (Phila.) **Treatise on Oxygen,** which is sent free to all who may ask for it. The subject is worthy of investigation. References to physicians in San Francisco, who use and prescribe Compound Oxygen in practice. As prepared for home use (conveniently sent to any address) it may be obtained of H. E. MATHEWS, 606 Montgomery street, S. F., upon the same terms as furnished by Drs. Starkey & Palen, Philadelphia, Penn. Complete instructions with each package.

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC SWITCH FOR WIRE-ROPE RAILROADS.—James W. C. Rhind, S. F. Patented June 15, 1880. No. 228,932. The object of this invention is to provide an automatic switching apparatus for that claes of railroads known as "wire-rope" railroads, where the power of propulsion is imparted by means of an endless rope. In the cable or wire-rope railroads the endless rope runs down the center of one line of track and up the center of the other under the surface of the street in a suitable tube, power being applied to the rope by engines at any convenient point. A dummy or small car coupled to the passenger car is provided with a grip. This grip projects down below the level of the roadway at all times, and the dummy on which it is placed precedes the car. At the end of the line it is necessary for the car to be passed ahead of the dummy, and the car must therefore be switched off to the other track first, and the dummy follow it, so as to come in front on the return trip. The way in which this is done at present is that just before reaching the switch the car and dummy are disengaged, and the dummy passes on a short distance ahead over the closed switch point. As soon as it passes an attendant shifts the switch, which turns the following passenger car off onto the up-track, and it runs on down to the end of the line, the dummy having meantime been stopped. The dummy with its grip drawn up clear of the endless cable, then crosses over by a curved track or another switch and comes in behind the car so as to be ahead of it in starting up again. The switch over which the paseenger car goes must be closed to allow the dummy first to pass down the line, and then opened to allow the car to come over to the other track. The present invention consists in providing a movable switch, which is so connected by euitable levers under the level of the track, that the said levere may be automatically moved at the proper time by means of the downward projecting grips, so as to open and close said switch at the proper time for both dummy and car.

VELOCIPEDE.—F. Langmaak and Peter Streiff, S. F. Patented June 15, 1880. No. 228,908. This invention consists in placing within the open hub of a single wheel, a carriage provided with driving and guide wheels moving in an annular groove inside the hub, this carriage being provided with a saddle upon which the rider sits astride, combined with operating foot-levers, which, hy means of cords, rotate alternately clutches on the shaft of the central driving-wheel of the carriage. These clutches are so arranged that they engage with the driving-shaft on the forward motion, but release it when the foot is drawn hack for the return stroke. By having a pair of the levers an alternate motion is kept up and a continuous revolution of the driving-wheel maintained. A velocipede of this form will not he as difficult to ride as those where the rider has to sit in a saddle over the wheel, owing to the weight being helow instead of above the center of gravity.

OVERALLS.—Samuel R. Krouse, S. F. Patented May 25, 1880. No.227,981. This invention relates to certain improvements in the manufacture of overalls and that clase of garmeuts intended for outside wear; and it coneists in an improved construction and application of strengthening-strips, stays, and re-enforce pieces hy which the body of the fabric, pocket corners and seams are strengthened, the parts are unitsd to form a more complete mutual band or support, while from their form a considerable economy of material is effected in the cutting of these parts.

BELT-TIGHTENING ATTACHMENT FOR SEWING MACHINES.—Joseph H. Allen, Sacramento, Cal. Patented, June 15, 1880. No. 228,850. This invention consists in providing a swiveled adjustahle arm carrying an adjustable extension with a friction-roller, by means of which the pressure on the belt, and the angle of said pressure may be regulated at will. The device is so simple that it is readily changed, so as to be adjusted for light or heavy work.

PREPARATION OF LIME-JUICE.—John and Thomas D. Douglas, S. F. This invention relates to a compound which is intended for making lemonade, seasoning etc., to take the place of limes. The compound is useful for making lemonade, being designed to take the place of limes or lemons. It is agreeable to the taste, will not decompose with age, and is always ready for use. It is put up in bottles of convenient size, and has the appearance of ordinary lime-juice.

News in Brief.

THERE are 150 prisoners in the Nevada State Prison.

THERE are nearly 20,000 Roman Catholics in Japan.

THE ascertained population of Salt Lake City is 20,757.

THE hours of labor are much longer in France than in England.

GREEK pirates have sacked the town of Alkiel, Asia Minor.

THE cattle plague has been raging in and around Shanghai, China.

THE seventeen-year locust has made its appearance in eome parts of Ohio.

A LONDON dispatch from Berlin June 20th, states that 63 persons were killed during the late terrible storm and water spout near Dreeden.

THE prospects of the Ceylon coffee crop are unfavorahle, and the government yield of Java will probably be 30,000 tons below that of 1879.

AN experimental shipment of fifty harrels of Spitzenherg and Rhode Island Greening apples was lately made from San Francisco to China.

CHARGES of cruelty, immorality and harsh treatment against the managers of the Ohio Lunatic Asylum are being investigated in Columhus.

AN explanation is to be demanded from the Spanish Government in regard to the recent firing upon an American schooner by a Spanish war vessel.

BRET HARTE delivered a lecture to a distinguished, numerous and enthusiastic audience, in London on June 21st, on the subject of "The Argonauts of '49."

DR. JOKHELES, surgeon of the Third Don regiment, who was recently buried with military honors, is said to have been the first Russian Jew thus honored.

LORD RIPON contemplates raising the moral tone of the Viceregal Court in India. In no caee will he kiss the ladies who honor hie Court with their presence.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Complied from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of $1. Address, Dewey & Co., 202 Sansome St., S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct (or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omissions of agents.

SAN FRANCISCO, May 25, 1880.

MESSRS. DEWEY & CO.—GENTLEMEN:—In acknowledging receipt of my two patents, I desire to express my thanks for the prompt attention which my business has received. The successful manner in which you have conducted the same shows a marked ability as Patent Agents, and I shall take pleasure in recommending your firm to all who desire to obtain patents. I have received copies of the MINING AND SCIENTIFIC PRESS containing descriptions of my inventions. With the best of wishes, I remain.

Yours truly, LOUIS BEGON.

By Universal Accord,

AYER'S CATHARTIC PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable, no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

FOR SALE BY ALL DEALERS.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento valley. His advertisement appears from time to time in this paper.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

Chew JACKSON'S BEST Sweet Navy Tobacco.

Mining and Other Companies.

Persone interested in incorporated sharee will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the eame.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, Room 37, S. F., June 15, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, Dividend (No. 56) of Fifty cents (50c.) per share was declared, payahle on SATURDAY, June 19, 1880. Transfer hooks closed until Monday, 21st.

W. W. TRAYLOR,
Secretary.

DIVIDEND NOTICE.

Office of the Spaulding Gold and Silver Mining Company—A Stock Dividend has this day heen declared, payable to the Stockholders of this Company, on and after the 10th day of June, of three shares of the Republic Mining Company's stock for each five shares of this Company's stock, on presentation of the certificates of stock of this Company.

JOHN HEIN, Secretary.

Office—117 Battery street, San Francisco, Cal.
Saturday, May 29, 1880.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 42), levied on the Fifth day of May, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

ALD in accordance with law and an order of the Board of Directors made on the fifth day of May, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, room 8, No. 402 Front street, San Francisco, California, on Wednesday, the fourteenth day of July, 1880, at the hour of one o'clock P. M. of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

W. O. WILSON, Secretary.

Office—No. 402 Front street, room 8, San Francisco California.

Some fine sunny offices (next to the PRESS office), to rent (at very reasonable rates), by Dewey & Co., at 202 Sansome street, corner of Pine.

A CARD.

ELEVATOR ACCIDENTS.

On January 1st, 1880, the Cage of an Elevator built by me in Robert Sherwood's Union Block, and in the store occupied by Albert Mau & Co., fell and injured three persons who were upon it at the time. This is the first and last instance in which any person has ever been injured by any of my Elevators, and this would not have happened had not the machinery in the basement been tampered with, and the nuts changed on the end of the piston rod.

The Safety Arrangements on the majority of the Elevator Cages, as well as on those previously erected by me, will only act and prevent the cage from falling when the cage rope breaks. Should the machinery below give way, as was the case at Albert Mau & Co.'s and Bauer, Tobriner & Co.'s, the Cage must inevitably fall, with results probably more serious than the accident mentioned. Since then I have spent a great deal of time, study, labor and money to invent some positive safety, which I have at last succeeded in doing. I now place it before the public with the following merits:

I claim that it is light, simple, noiseless, durable and positively an absolute safety. They can be seen in operation at A. B. McCREERY'S BUILDING, 310 Pine St.; ROBERT SHERWOOD'S UNION BLOCK, corner Market and Davis; CYCLOPS MACHINE WORKS, 115 and 117 Beale St.; J. C. JOHNSON & CO., 12 Pine St.; SROUFE & McCRUM, Union Block; ALBERT MAU & CO (2), Union Block; LANGLEY & MICHAELS, Pine and Front; KEANE BROS., 107 Kearny St.; B. NATHAN & CO., 126 Sutter St.; ROSENBAUM & CO., 22 Battery St.; NEUSTADTER BROS., Pine and Battery; F. TOPLITZ & CO., 571 Market St; BAUER, TOBRINER & CO., 547 Market St.; HIBERNIA BANK BUILDING, Montgomery and Market; FECHEIMER, GOODKIND & CO., 18 Sansome St.; A. B. ELFELT & CO., 108 Sansome St.; ACADEMY BUILDING, 330 Pine St; L. DINKLESPIEL & CO., Battery and Pine. The price each for them complete and attached to a Passenger Car, is One Hundred and Twenty five dollars ($125); attached to a Store Cage, complete, One Hundred dollars.

Yours very truly,
PHILIP HINKLE,
116 & 118 Main Street.

We, the undersigned, Engineers and Mechanics, have made an examination of Philip Hinkle's Patent Safety Catch for Elevators, and find it to be light, simple, cheap, noiseless, durable, and a positive safety.

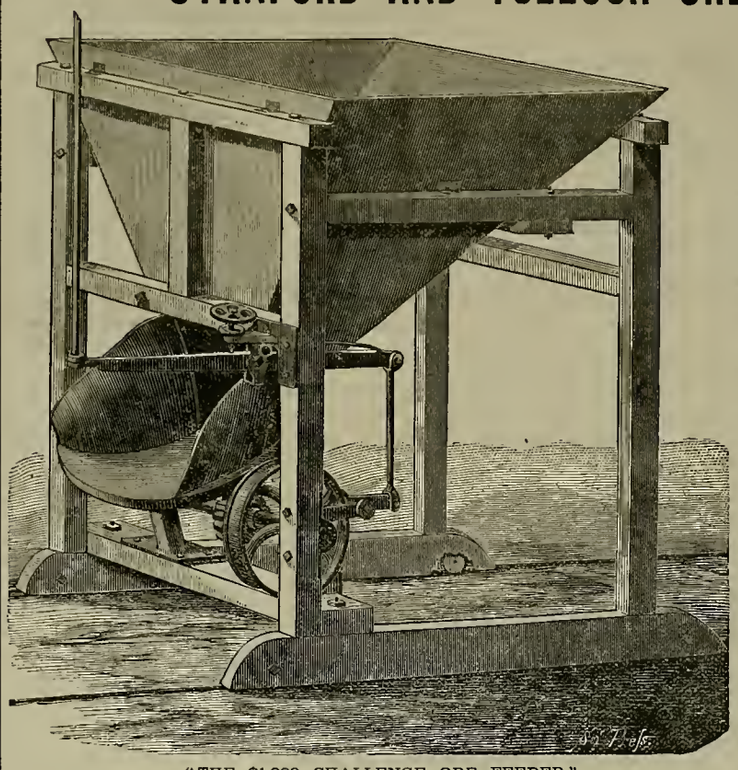
The $1,000 Challenge Ore Feeder

AT REDUCED RATES.

— ALSO THE —

STANFORD AND TULLOCH ORE FEEDERS.



"THE $1,000 CHALLENGE ORE FEEDER."

Several Hundred of the Famoue

CHALLENGE ORE FEEDERS,

Are in use in many mills on this coast, and wherever used give great satisfaction.

The STANFORD Feeder, made by me, has superseded the Victor Ore Feeders, furnished by E. T. Steen, in the Alexander mill, J. B. Cooper, President, office, Safe Deposit Building, S. F. By special permission I am enabled to refer interested parties to Mr Cooper.

In this connection I will state that I will give $50 to be shown up to this date one of the Eclipse Ore Feeders, manufactured by Prescott, Scott & Co., of the Union Iron Works, which is in general successful practical operation at any quartz mill on this coast.

I have made a specialty of manufacturing ORE FEEDERS, and know which will give satisfaction for steady work. The Improved

STANFORD FEEDER

Will beat any one in use—always excepting the CHALLENGE, which is THE BEST OF ALL.

By use of CHALLENGE ORE FEEDER there is 15 per cent. less wear and tear of iron than by hand feeding. There is also 20 per cent. more ore crushed.

I make at my works

The Challenge

AND THE

HENDY ROCK BREAKERS.

The CHALLENGE is the best rock breaker at work today. The HENDY is the newest thing in this line, and is worthy of close examination by all mill men. Call and see it.

JOSHUA HENDY,

Manufacturer of Hendy's Concentrator, Automatic Ore Feeders, Mining and Saw Mill Machinery, Etc.

All ordinary mending, sewing on buttons, etc., free of charge. ☞ Orders left at the office will receive prompt attention. Work called for and delivered to any part of the city free of charge.

RUBBER BELTING,

Steam Packing,

Fire Engine, Hydrant and Suction Hose,

RUBBER VALVES,

GASKETS AND SPRINGS MADE TO ORDER AT SHORT NOTICE.

Rubber Boots and Shoes, Clothing, heavy and light, and all other kinds of Rubber Goods, for sale by

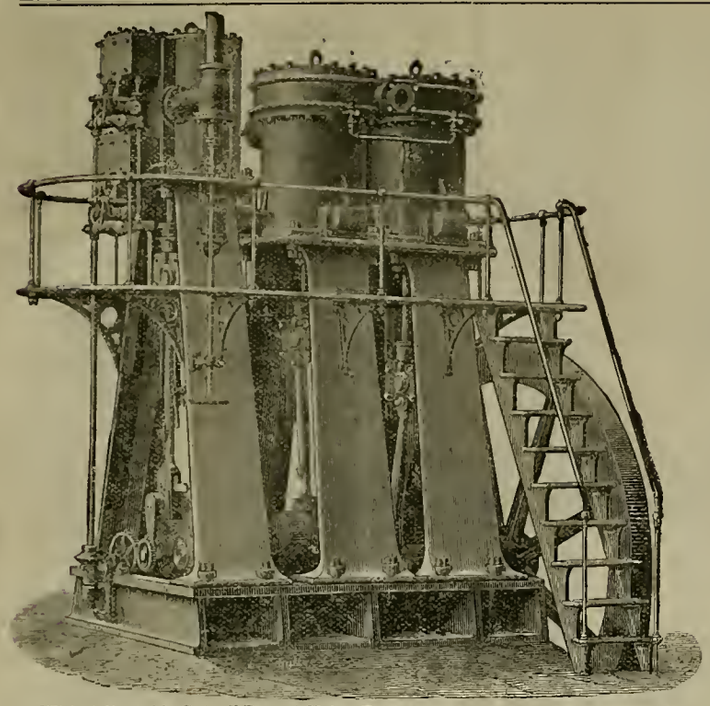
The Gutta Percha & Rubber Man'fg Co.,

J. W. TAYLOR, Manager,

Cor. Market and First Street, SAN FRANCISCO.

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.



With Adiustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressnre. The heating of the air entirely prevented at any pressure. Takes less water to cool tbe air than any other Compressor.

Power applied to tbe hest advantage. Access obtainable to all the valves hy removing air chest covers. Entire absencc of springs or friction to open or shut the valves. No valve stems to hreak and drop inside of cylinders.

Have no back or front heads to hreak. The only Machine that makes a perfect diagram. No expensive foundations required. Ahsolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of ahout 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

FRUE'S ORE CONCENTRATOR OR VANNER.
Plunger Jigs. Revolving Screens.
CRUSHING ROLLERS. SAMPLE GRINDERS.

FRASER & CHALMERS
STEAM ENGINES, BOILERS, STAMP MILLS, FRUE VANNERS
and Machinery for Systematic
Mining, Milling, Smelting and Concentration of Ores.
No. 145 Fulton St., CHICAGO, ILL.

Howell's Improved White Roasting Cylinders.
REVOLVING CYLINDERS AND ORE DRYERS.
Hoisting and Pumping Machinery.

PATENT

LIFE-SAVING RESPIRATOR

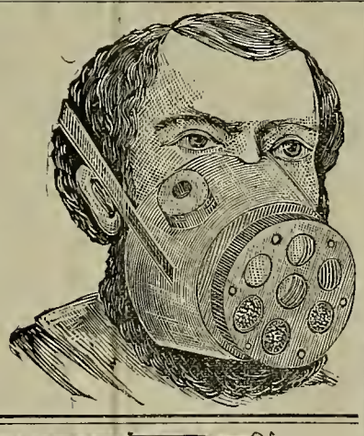
Prevents Lead Poisoning and Salivation.

INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

SETH MARSHALL, Jr., Agent,

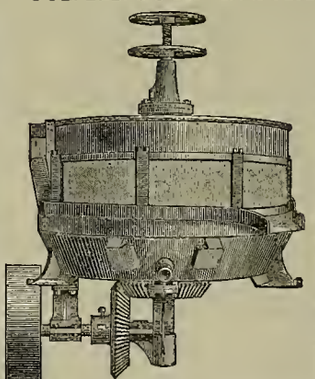
309 California Street, San Francisco, Cal.

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.



STEIGER & KERR'S

CONTINUOUS DISCHARGE AND GRINDING PAN.



This pan is designed to receive ore direct from a rock breaker, and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adopted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the **OCCIDENTAL FOUNDRY, STEIGER & KERR,** 137 First St., S. F.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

Testimonials as to the perfect working of the Concentrator to be seen at the office.

VULCAN BLASTING POWDER.

The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which are prepared to sell at LOWEST RATES.

No. 1.—Equalling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.

No. 2.—Will do the work thoroughly in all but the hardest kinds of rock.

No. 3.—For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Caps, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Exploders, For Sale at the Lowest Ratee.

VULCAN POWDER COMPANY,

Office, 218 California Street, - - - - - SAN FRANCISCO, CAL

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

GOLDEN GATE ACADEMY.

OAKLAND, CAL.

A First-class Boarding and Day School will begin its next term July 27, 1880. For information visit the Premises or apply to Rev. H. E. JEWETT, M. A., Principal.
